The best that electricity has accomplished, he says, is the symptomatic cure, which does not remove the tumor, but leaves it as a continual reminder of the possible recurrence of all the bad symptoms. Palliative treatment is for those who will not submit to a radical operation, and as a means of preparation for radical measures. Foremost among palliative measures is galvanism. It will relieve pain, will often check hemorrhage, but will seldom cause reduction in the size of the growth. Galvano-puncture is not approved of; it is too apt to expose the patient to the dangers of sepsis and peritonitis. If the tumor and uterus are to be removed, the method of complete extirpation will usually be preferable to any which leaves behind a stump or pedicle.

Dr. Frank W. Talley discusses

**Exploratory Cœliotomy for Ascites Abdominalis,**

reporting two cases. The author advocates an exploratory laparotomy for the relief of the trouble rather than the old method of tapping, as by the first procedure the finger introduced into the abdominal cavity is able to recognize the seat and character of the disease, which can be removed at that time or at a subsequent operation.

Dr. J. M. Baldy contributes a paper on the "Removal of the Uterus and its Appendages for Pelvic Inflammatory Disease." The author takes the ground that the uterus is the original source of the trouble and that it is a useless organ after the appendages have been removed. When it is infiltrated with pus, therefore, it should be removed along with the appendages.

The remaining papers in this month's issue are: "Hydatidiform Mole of Uterus," by Dr. Horace Fox; the "Synopsis of One Hundred Operations for Severe Structural Diseases of Abdominal and Pelvic Organs of Women," by Dr. I. S. Stone; and "Notes in Regard to Uterine Fibro Myomata," by Dr. Nicolas San Juan.

In the Department of Pædiatry, Dr. J. Madison Taylor contributes a clinical lecture on "Enlaged Tonsils; Umbilical Hernia; Blood Dyscrasia Following Erysipelas, Complicated by Extensive Nævus."

# PERISCOPE.

IN CHARGE OF WILLIAM H. BRICKER, M. D., B. SC.

## THERAPEUTICS.

### Action of Bicarbonate of Sodium on the Digestion.

Linossier and Lemorne (*Nouveaux Remedes; N. Y. Therap. Review*) have made experiments concerning the action of bicarbonate of soda on the digestion of a patient with regurgitations and have drawn the following general conclusions:

1. Bicarbonate of soda administered in any dose, even of ten grammes, is a stimulant of the gastric secretion.

2. One hour after digestion this stimulation of the gastric secretion produces the first saturation of the alkali.

3. If the dose administered is small, the stimulation of the secretion continues after the alkali has been neutralized, and causes a slight temporary increase of muriatic acid.

4. If the dose is medium, the stimulation lasts longer. The maximum proportion of muriatic acid in the contents of the stomach is attained more slowly, but is larger.

5. If the dose is a large one, the secretive function exhausts itself to neutralize the alkali, and the proportion of muriatic acid may be less than it is normally when the food leaves the stomach.

6. The time required for the muriatic acid to attain its maximum proportion in the chyme, is as follows for the different doses: two hours after a dose of 0.5 grams of bicarbonate of soda; three hours for a dose of 1 gram, and four hours for a dose of 5 grams.

7. Given one hour before meals, one gram acts as a small dose, five grams as a medium dose, and ten grams as a larger dose. Given just before meals, 0.50 grams is a small dose, 1 gram a medium dose, and 5 grams a large dose.

8. The doses producing the best stimulation are consequently 1 gram just before meals, or 5 grams one hour before.

9. Bicarbonate of soda, given just before meals, suspends the secretion of pepsin.

10. The saturative action of bicarbonate of soda, administered in a dose of 2 grams one hour after a meal was very slight and without

stimulation; the action lasted longer but equally without producing stimulation after a 5 grams dose, and definitely after a 10 grams dose. That is to say the normal proportion of acid had not been recovered at the end of the period of digestion.

The practical conclusion to be derived from these experiments, as far as the treatment of hypersecretion of muriatic acid (hyperchlorhydria) is concerned, is that, in order to avoid the consecutive phenomena of excitement, repeated small doses, producing only incomplete saturation should be used before large doses. A medium dose may cause only a temporary relief followed by an increase of the symptoms. The doses will usually vary, with different patients.

11. Carbonate of calcium would probably be superior to bicarbonate of soda in the treatment of hyperchlorhydria, as after its use, and with an equal quantity of acid secreted as follows the administration of bicarbonate of soda, there is no production of free acid.

12. The action of the alkalies continues after meals during which they have been administered. The stimulation of the secretion is still observable two days after the last dose has been given.

13. Abnormal fermentations are enhanced by the administration of bicarbonate of soda from the moment of its ingestion to the reappearance of normal acidity, and may continue thereafter. The only case in which abnormal fermentation seems to be stopped despite the administration of the drug, is when it is given in small doses one hour before meals.

14. From a therapeutic standpoint, bicarbonate of soda is essentially a remedy for the insufficiency of gastric secretion, and must be administered preferably some time before meals. In hyperchlorhydria it is only a palliative remedy, which is liable to aggravate the general course of the disease by exciting the mucous membrane, which in this case is already too much excited. The administration of muriatic acid might be of some service in diminishing the secretive activity of the glands. Further experiments will be made to verify this hypothesis.—*Med. Review.*

### Preliminary Report on the Disinfection of Clothing, Leather Goods, Brushes, and Books with the Formaldehyd (Formalin).

Prof. Lehmann had performed a series of experiments with a 40 per cent. solution of formaldehyd, called formalin, on silk and woolen clothing, books, combs, leather goods, etc., which were infected with cultures of vibrio choleras asiaticas, staphylococcus pyogenes aureus, bacillus prodigiosus, and anthrax spores. When the articles were so arranged as to allow the fumes of formalin to come in contact with them, there was seldom a disappointing result to be recorded, and that without any damage whatever to the fabric acted upon. The most satisfactory method employed was to place the articles to be disinfected in a box, together with a cloth or absorbent paper moistened with formalin, in alternate layers; the box was then closed and left undisturbed for 24 hours. There is an unpleasant and irritating vapor arising from the formalin; the irritation can, in time, be tolerated; the odor, however, is readily set aside by spraying aq. ammonia upon the article disinfected with formalin.

The author suggests the use of two chests for use in the household for disinfection purposes after contagious diseases. The first for the use of formalin, and the second to expose the articles to ammonia. This can be done without injury to clothing, brush, leather goods, combs, etc. He likewise recommends its use by barbers and in circulating libraries. Formalin (40 per cent. of formaldehyd) is non-combustible, and its vapor non-explosive. Small articles, entirely enveloped, can be disinfected in from five to six hours.—*Munch. Med. Wochenschr.*

---

### Chloroform Mortality in Australia.

In the *Australian Medical Gazette* for August is a short paper dealing with the mortality from chloroform in Melbourne and suburbs during the past five years. In 1888 there were 2 deaths; in 1889, 6; in 1890, 1; in 1891, 4; in 1892, 3; or a total of 16, that is to say, an average of over 3 per annum. The author points out that the death-rate from chloroform is about three per annum in an average population of 450,000. Thus, chloroform on this calculation is proved to be rather more dangerous to life than snakes, inasmuch as the death-rate from snake-bites for the whole colony and chloroform for Melbourne are about the same. It appears to be impossible to make any estimate of the number of chloroform administrations, so that the percentage of deaths to the administrations is merely a matter of conjecture.—*Med. Press and Circular.*

---

## MEDICINE

### Deaths from Anæsthetics in Germany.

The Collective Investigation (Anæsthetics) Committee gave the results of their work at the 22nd Surgical Congress held at Berlin in April. "Fifty-eight reports had been received during the year, comprising 57,541 cases of administration of anæsthetics, 11,564 of which were administrations of nitrous oxide in dentistry, leaving 46,077 with other anæsthetics with 12 deaths. These results, added to those of the two previous years, make the total 159,814 cases of narcosis, with 53 deaths, or one in 2,977. The chloroform cases were 138,609, with 46 deaths, or 1 in 2,839; the ether cases were 14,506, with no death; mixed chloroform and ether, 1 death in 4,118; narcosis with Billroth's mixture of ether, chloroform and alcohol, 3,450 cases, with one death; bromide of ethyl, 4,538 cases, and one death; 597 cases of narcosis with Pental resulted in 3 deaths, or 1 in 199."—*Med. Press and Circular.*

### Hereditary Ataxia.

Sanger-Brown, of Chicago, minutely describes twenty-one cases of hereditary ataxia, all belonging to a single family, and comprising four generations. The author is inclined —with a certain reserve—to consider these cases as hereditary ataxia, but also recognizes the fact that they differ in some important features from the type usually presented by this disease. These important deviations, which Ormerod and Bernhard also call attention to, are the following:—

1. In true hereditary ataxia (Friedreich's form), the disease usually presents itself between the ages of 12 and 18, while in the cases quoted by Brown it frequently manifests itself much later (for example, at 45 years).

2. The majority of his patients were not of the female sex; it would appear that the disease is simply transmitted through their agency.

3. Brown frequently, though not invariably, observed ptosis, which is generally absent in Friedreich's form.

4. Amblyopia and amaurosis, which are never observed in Friedreich's disease, were constant and early symptoms in Brown's cases.

5. In the latter, the knee-jerk, which is absent in the former, was increased, foot-clonus being also present.

6. Brown did not observe club-foot nor scoliosis.

7. Pupil-reaction was deficient in Brown's patients,—a fact not to be wondered at, since in the majority of cases there was optic atrophy; a symptom which does not occur in Friedreich's disease.

As Brown did not have occasion to make a post-mortem examination in a single case, nothing positive could be determined concerning the nature of this disease. Undoubtedly, however, it closely resembles the hereditary ataxia of Friedreich.—*Brain*, No. 58.

---

### The Pathology of Nervous Disease.

In an instructive paper on this subject Dr. Charles W. Dana concludes as follows: I would sum up the points which I have tried to bring out and emphasize in the preceding remarks somewhat as follows:

(1) The term inflammation, as now understood, has to be applied more carefully and with restrictions to nervous diseases. Many forms or cases, for example, of meningitis and myelitis are in reality toxæmias or processes secondary to mechanical injury. There cannot be an inflammation without a specific cause, and we should associate this fact with our conception and our diagnosis of the inflammatory processes.

(2) In the organic neuroses of degenerative type there is a toxine of extrinsic or intrinsic origin, which is negatively chemotactic. The body cells and proteids cannot defend the special parenchyma, against it. The degenerations, including muscular atrophies and primary sclerosis, are of toxic origin. There is a poison at work which it should be the effort of neurological science to find out how to antagonize and combat.

(3) In the chronic neuroses of functional origin, so-called, such as paralysis agitans, chorea, epilepsy, and Basedow's disease, there is a toxic factor which is of fundamental importance. This may be due to defective gland action as in Basedow's disease and in myœdema or to humoral poisons of other origin. Many neuroses are really glandular or nutritive or infection diseases.

(4) There is another element of equal importance in the etiology of the neuroses, and that is an inborn or an acquired lack of resistance to injurious agencies, whether engendered within or introduced from without. This diminished power of resistance on the part of nerve-centres is produced in some cases by strong emotions and shocks; and while under this depressing influence, the nerve-centres become susceptible to the action of the poisons which then continue and keep up the disease. In some such way as this we may explain the origin of paralysis agitans, certain forms of neurasthenia, and exophthalmic goitre, perhaps, also, even of the organic neuroses like locomotor ataxia. These views lead to the practical conclusion, that in treating many of the chronic neuroses there are two kinds of measures to be employed: first, those which increase strength and resisting powers of the organism; second, those which are of antitoxic or specific character. There are, in all probability, specific cures for many of the diseases which we now regard as hopeless; remedies which will stop the progress of locomotor ataxia and progressive muscular atrophy, and which will neutralize the poisons that keep up exophthalmic goitre, paralysis agitans, epilepsy and other neuroses.

(5) The toxic origin of nervous diseases has been established in the case of myxœdema and made probable in that of exophthalmic goitre, paralysis agitans and chorea; and the importance, at least of a toxic element has been shown for epilepsy.

(6) Finally, by the term toxine or poison is meant a very wide range of injurious substances, including the products of defective metabolism, defective gland action, microbic growth, and the extrinsic vegetable and mineral poisons.—*Boston Med. and Surg. Jour.*

---

### Chloroform as a Tape-Worm Remedy.

Dr. Stephen (*Il Raccog. Med.*) has recently confirmed the action of chloroform as a tænicide, he having been able to expel tapeworms with this remedy which had resisted all other measures. He employs Thompson's formula:

℞ Pure Chloroform (ʒj) ..... gms. 4
Simple syrup (ʒj) ..... gms. 30

To be taken in four doses, at seven, nine, eleven and at one in the afternoon. At noon take an ounce of castor oil.

All his patients bore the chloroform well, and it was even administered to children in proper proportions.

### The Antiseptic Treatment of Burns in Children.

Eight cases of burns in children, 10 months to 10 years of age, are reported by Mme. Wilbouchewitch caused by boiling fluids or flames, and ranging from the 1st to 3d degress; four of these healed without suppuration in 14 days or less. The others gave brilliant results, despite suppuration of small portions of the wounds. The frequency of burns in young children and the serious results to the usefulness of the member from contracting scars, not to speak of the danger to life from septic absorption, makes the subject one of uncommon interest. Before the days of antisepsis all burns in which the skin was detroyed suppurated under all forms of treatment. Fever, chills, and other signs of infection were common. Patients died as late as the twelfth, twentieth, forty-first, and forty-ninth day. Weeks elapsed before the healing was complete. It was first found that cauterization for counter-irritation, if made upon a surface rendered aseptic, healed under a simple dry antiseptic dressing without suppuration. Pyogenic microorganisms upon the surface of the skin will often resist heat sufficient to cause a burn of the 2d degree. Even tissues which have been charred are readily infected by clothing and subsequent manipulation. Every burn therefore should be treated as an infected wound. Thorough cleansing of the parts is the most important requisite. General anæsthesia is often necessary for this, especially in children, but burned children bear chloroform well. The dressing should be surgically complete, yet so gentle as not to further injure the damaged tissues. Burns of the 1st degree, with swelling and redness, do not become infected, but upon these later blebs may rise. Burns of 2d degree with intact epidermis are best cleansed with clean or antiseptic soap and water; first the uninjured portions, then the burned surface. Ether is often of service in fissures or about the nails, or when oily applications have previously been made. Then the parts are bathed with antiseptic solutions. Where there are unbroken blisters, healing will take place without infection even under a dirty skin, but it consumes more time than under antiseptic treatment when the skin is removed. If torn, it is always best to remove it. Soap may be used where the skin is absent. It does not cause bleeding, although this easily results from removing the skin. Cases which have suppurated but a short time may be completely disinfected. Those of six or eight days' duration will probably still produce pus but in much diminished quantities. Burns of the 3d degree with the formation of scars should be disinfected with the greatest care, especial care being used about the scars, ether employed if necessary and any which are loosened by suppuration removed with a spatula. Antisepsis thoroughly carried out, the choice between the different dressings and antiseptics is not of so much importance. Moist and fatty dressings, continuous baths, and impermeable dressings retard keratinization and should be discarded. Iodoform is often useful but may be toxic. The subnitrate of bismuth is far preferable when the injuries are not infected. Thiol and ichthyol give excellent result. Thiol dries and forms a pellicle over the surface and then is followed by a simple dressing. So treated burns frequently heal under a single dressing in eight to fifteen days without cicatrices. Even if deep, the cicatrices are but slightly visible and do not contract.—*Rev. Mens. Mal. L'enfanee.*

---

### Rapid Death from Carbolic Acid.

A most determined suicide is reported from Dover. A servant girl, having ascertained that her mistress had gone out, went upstairs and drank, so it is said, about 60 ounces of carbolic acid, which was kept for disinfectant purposes. Almost immediately afterwards a lad in the house noticed a strong smell of the acid, and went upstairs where he found the girl dreadfully disfigured and dead in a chair. This case has two points of medico-legal interest: first, the large quanity of the poison taken, and secondly, the rapidity with which death ensued. From the evidence it is clear that the unfortunate girl suffered from suicidal mania, as she had previously made two attempts upon her life, once by jumping down a well and once by taking a poisonous lotion. —*Med. Press and Cir.*

---

### Hydrastis in the Treatment of Night-Sweats.

Olzewski-Krakau (*Apotheker Gazette*) has employed fluid extact golden seal in doses of twenty-five to thirty drops two or three times daily, in the night-sweats of pneumonia, intermittent fever, tuberculosis, etc., with great results. Especially in phthisis were the effects admirable—but only in two patients, however, out of ninety-three, the remedy in the others unfortunately causing vomiting.—*Medical Age.*

---

### Treatment of Some Irritable Conditions of the Stomach.

According to Hemie the cause of cardialgia is spasmodic contraction of the gastric openings, especially the cardiac. Above this there is often a dilatation of œsophagus, in which air and food are enclosed, giving rise to spasm. In dilatation of the stomach and very loose abdominal walls, it may go on without spasm to painful sensations in the cardiac end by traction of the full stomach on the œsophagus, and to collection of air from closure of the cardia after the organ is thus distended. Likewise, as a result of swallowing air and after the ingestion of certain foods, cardialgia may be produced by undue distention of the stomach. By this immoderate distention cramp at the pylorus may also arise, although with pyloric spasm the distention is usually an effect of the cramp, not the cause of it, the spasm being set up by other conditions, such as irritating

contents, especially when increased irritability co-exists of the pyloric portion. For spasmodic cardialgia many remedies have been tried. Subnitrate of bismuth enjoys a great reputation. Morphine acts quickly and strikingly, but temporarily, and leads to lax gastric walls. Gastric pain is produced by irritation of ulcers and sensitive spots in the stomach as well as by spasm. Food or over-acidity of the gastric juice excites these places, and pain is the result. If these are supplied with a protective covering, much is done to relieve suffering and encourage healing at the same time. Russmend has recommended subnitrate of bismuth for this purpose. It can be taken in large doses with safety; and as it rapidly falls from watery suspension, it forms a covering for the irritable organ. The method adopted is to wash out the stomach, and pour in ten to twenty grains of bismuth in lukewarm water, and keep the patient at rest for half an hour until it settles; food may then be taken. At first the washing out may be daily; then on alternate days. Toxic symptoms do not arise. The results are excellent, as the troubles even in old and hopeless cases are relieved, and the feeling of improvement continues for several days. That bismuth actually forms a protective covering may be inferred from membranes of that substance seen when the next washing out takes place. It is probable that it is firmly deposited on ulcerated parts, and by its protective action relieves pain and lessens the motor unrest of the stomach and spasms. Over-acidity is diminished and starchy food is better borne after it.—*Berlin klin. Woch.*

### Inebriety.

As a good tonic Dr. Edward C. Mann, of Brooklyn, N. Y., recommends:—

℞
Quiniæ sulph..... gr. ij.
Zinc oxide..... gr. ij.
Strychnia sulph..... gr. 1-40.
Arsenic..... gr. 1-100.
Capsicum..... gr. ij.
M. et ft. pil. no. j.
Sig.: One three times a day.

Together with this pill, Dr. Mann uses, for sixteen days, the following hypodermic dosimetry:—

℞
Strychnia nitrat..... gr. j.
Aquæ dest..... ʒss.
M. Sig.: Eight minims daily for eight days; 4 minims daily for another eight days. To quiet the morning nausea of alcoholics, 2 or 3 drops of wine of ipecac on the tongue, fasting.

To induce sleep the following sedative is administered at night for a few days:—

℞
Tinct. opii deod.,
Ext. hyosc. fid.,
Chloral hydrat.,
Pot. bromid.....āā ʒij.
Tinct. capsici..... ʒss.
Tinct. aconit. rad..... mv.
Aquæ menth. pip.....ad ʒiv.
M. Sig.: Two tablespoonfuls at bed-time for a few days only, freely diluted with water.

If the patient is very much excited, and is bordering on delirium tremens, the following is useful for two or three nights:—

℞
Hyoscin. hydrobromat..... gr. j.
Aquæ dest..... ʒix.
Spt. vini rect..... ʒj.
M. et ft. hypodermic solution.
Sig.: Dose from 5 to 10 minims *pro re nata.*

—*Vir. Med. Monthly.*

### Ringworm of the Scalp.

Dr. Leslie Roberts lays down the following rules for observation in the treatment of ringworm of the scalp.

1. Whenever practical, shave the entire scalp. This in itself constitutes rather a treatment than a preparation for it. Every hair in the head is a means of retaining moisture and heat, which favors the development of ringworm as a poultice would a boil.

2. Disinfect the whole surface of the scalp. It is not necessary to only treat the ringworm patch, the whole surface must be thoroughly disinfected. For this he recommends spraying the scalp morning and night with rectified spirits containing a few grains of salicylic acid and a little glycerine.

3. Stimulate the follicles containing the diseased hairs. At this point in the treatment the mechanical barrier to the penetration of remedies existed in the horny layer of epidermis. He was not convinced that any remedy penetrated far into the depths of the follicles. A very mild antiseptic would kill the germs so far as it reached them, but it was doubtful if they reached far enough.

4. Selection of remedies. The choice of a remedy should not be confined to the germicides, but such agent should be selected as had influence on cell life; iodine, carbolic acid, ammonia, ether, chloroform, acetic acid, cantharides and capsicum were all of use.—*Brit. Med. Jour.*

### Acquired Syphilis in Childhood.

Dr. Fournier states that many physicians have the mistaken idea that syphilis in the child is almost always hereditary and very seldom acquired. Two points must be understood: (1) Syphilis is never acquired during childbirth, because at birth, the child is already syphilitic. (2) An acquired syphilis is never dependent upon syphilis of the mother, which she acquired before the child's birth, for here, again, the child is born syphilitic, although it may be latent. The positive causes of contagion are thus reduced to:

1. Nursing, by which a previously syphilitic nurse infects when she develops patches in her mouth, or papules upon the nipple, or by a nurse who is herself infected by nursing a second and syphilitic child.

2. During its growth; by its mother, subsequently affected; by its father, by its attendant, especially by kissing; by other persons with whom it comes in contact.

3. Criminal attempts.

4. Inoculation by physicians, or midwives, either by the hands or by instruments.

Fournier concludes that children acquire syphilis more often than is supposed.—*Rev. Gen. Clin. Therap.*

## GYNECOLOGY.

### Hysterectomy for Cancer of the Cervix by Combined Abdominal and Vaginal Dissection.

Dr. M. H. Richardson in a paper on this subject offered the following conclusions.

The advantages of the vaginal method are:

1. Less liability to peritoneal contamination.
2. More intelligent and thorough dissection of the local disease.

Its chief object is the difficulty in controlling hemorrhage.

The advantages of the abdominal method lie:

1. In a conclusive investigation of the disease itself—its local extent and its possible remote metastases.
2. In the rapidity and safety by which the broad ligaments may be tied and cut.
3. In the ease with which the ureters may be isolated and kept one side.
4. In control of hemorrhage.

Its chief disadvantage is the impossibility of thorough dissection and removal of the cervical portion of the disease.

The superiority of the combined method is seen:

1. In the intelligent and thorough dissection both of the local disease and the broad ligaments.
2. In the certainty by which hemorrhage may be prevented.
3. In the protecting of the ureters.
4. In the saving of time.

The combined method is applicable more especially to cases where the disease involves the cervix and a portion of the vaginal mucous membrane, and to cases in which the uterine body is large and fixed. It should also be employed where for any reason it may be difficult to separate the vaginal attachments.—*Bost. Med. and Surg. Jour.*

### Treatment of Ovaritis.

M. Winternitz has just published his method of treating women who suffer from ovaritis. Rest in bed is the first thing insisted upon, and, as these patients are generally constipated, he prescribes a teaspoonful of the following mixture at bed-time in a glass of water:

℞ Sulphate of soda ..... ʒjv.
Sulphur ..... ʒj
Sugar ..... ʒv.
Essence of peppermint, q. s.

The abdomen is rubbed with the ointment here mentioned:

℞ Ichthyol, } ..... aa
Lanoline, }

To this external treatment is added vaginal injections of warm salt water and twice daily the os is scarified.—*Med. Press and Circular.*

### Two Cases of Labial Chancre in Cigar-Makers.

Dr. W. S. Gottheil reports the cases of two young women, cigar-makers, each having an initial lesion on the upper lip. One thought she had acquired the disease from the other. Both of these patients finished the tips of their cigars with saliva, and this practice was universal in the factory where they worked. Under such conditions the danger of infection from cigars would seem considerable.—*Med. News.*

## OBSTETRICS.

### Craniectomy.

At the Paris Academy of Medicine Dr. Bourneville read a paper upon the above subject, which may be resumed as follows:

The examination of 350 crania collected in the Bicetre Hospital, proves that, in idiotic and backward children, premature synostosis of the sutures does not generally exists.

Inasmuch as the exact state of the sutures and the thickness of the cranium cannot be determined with any great degree of accuracy in the living, it must follow that craniectomy must be done without exact data, and frequently upon crania which are perfectly able to give the brain all the space it needs.

The examination of these crania shows, also, that craniectomy is not able to give the brain any very great degree of expansion. Thesefacts justify the statement of anthropologists who assert "that the brain makes the cranium, and moulds it upon itself." Besides this, the encephalic lesions, to which are due the greater number of the forms of idiocy; are deep, varied, and extensive, hence not susceptible of being monifled by craniectomy.

Most of the surgeons who have practiced this operation agree upon the fact that in most instances their operative messures have been followed by slight or doubtful results, or by no improvement whatever; that serious accidents (paralysis, convulsions, etc.) and even death (13 times in 85 operations collected by the author) have resulted from it.—*Semaine Medicale.*

## ARMY AND NAVY.

U. S. ARMY, FROM NOVEMBER 12, 1893, TO NOVEMBER 18, 1893.

Leave of absence for one month on Surgeons certificate of disability, with permission to go beyond the limits of the department, is granted First Lieutenant Madison M. Brewer, Assistant Surgeon, U. S. A.

The leave of absence granted Major Curtis E. Munn, Surgeon, U. S. A. is extended two months.

The leave of absence granted Captain Henry P. Birmingham, Assistant Surgeon, U. S. Army, is further extended one month.

Leave of absence for one mouth, is granted First Lieut. Charles E. B. Flagg, Assistant Surgeon, with permission to apply for an extension of twenty days.

Lieut. Colonel Charles R. Greenleaf, deputy surgeon general, is relieved from duty in the office of the Army, and will repair to San Francisco, California, and assumes charge of the medical supply depot in that

city, relieving Lieutenant Colonel Joseph P. Wright, deputy surgeon general, who upon being thus relieved, will repair to St. Louis, Missour, and assume charge of the medical supply depot in that city.

U. S. MARINE HOSPITAL SERVICE FOR THE FOUR WEEKS ENDING NOVEMBER 18, 1893.

Purviance George, Surgeon. To report at Bureau for temporary duty, November 7, 1893. To inspect Reedy Island Quarantinne, November 14, 1893.

Carter, H. R. Surgeon. To proceed to Jessup, Ga., for temporary duty, November 10, 1893.

Banks, C. E., P. A. Surgeon. To rejoin station, Portland, Maine, November 3, 1893.

Brooks, S. D., P. A. Surgeon. To inspect service at Ashtabula, Ohio, and then to rejoin station, Cleveland, Ohio, November 13, 1893.

McIntosh, W. P., P. A. Surgeon. Granted leave of absence for twenty-three days, November 17, 1893.

Magruder, G. M., P. A. Surgeon. Granted leave of absence for thirty days, November 1, 1893. To proceed to New Orleans for duty, November 15, 1893.

Goodwin, H. T., P. A. Surgeon. Leave of absence extended 30 days, October 24, 1893.

Cobb, J. G., P. A. Surgeon. Leave of absence extended 20 days, November 14, 1893.

Guiteras G. M., P. A. Surgeon. Granted leave of absence for 30 days, November 14, 1893.

Perry, J. C., P. A. Surgeon. To rejoin station Vineyard Haven, Mass., November 3, 1893.

Stewart, W. J. S., Asstistant Surgeon. To proceed to Reedy Island and Delaware Breakwater, Quarantine Station for temporary duty.

Strayer, Edgar, Asst. Surgeon. To rejoin station, Boston, Mass. November 3, 1893.

## NEWS AND MISCELLANY.

### Philadelphia Academy of Surgery.

THE SAMUEL D. GROSS PRIZE.

*The Quinqennial Prize of One Thousand Dollars under the will of the late Samuel D. Gross, M. D., will be awarded January 1, 1895.*

The conditions annexed by the testator are that the prize "Shall be awarded every five years to the writer of the best original essay, not exceeding one hundred and fifty printed pages, octavo, in length, illustrative of some subject in Surgical Pathology or Surgical Practice, founded upon original investigations, the candidates for the prize to be American citizens."

It is expressly stipulated that the successful competitor, who receives the prize, shall publish his essay in book form, and that he shall deposit one copy of the work in the Samuel D. Gross Library of the Philadelphia Academy of Surgery.

The essays, which must be written by a single author in the English language, should be sent to Dr. J. Ewing Mears, 1429 Walnut St., Philadelphia, before January 1, 1895.

Each essay must be distinguished by a motto, and accompanied by a sealed envelope bearing the same motto, and containing the name and address of the writer. No envelope will be opened except that which accompanies the successful essay.

The Committe will return the unsuccessful essays if reclaimed by their respective writers, or their agents, within one year.

The Committee reserves the right to make no award if the essays submitted are not considered worthy of the prize.

The next meeting of the Pennsylvania State Medical Society will be held in Gettysburg, May 15th, 16th, 17th and 18th, 1894.

It is expected that the historic associations of the famous battlefield will attract an unusual attendance. Those desirous of presenting papers are requested to notify the Committee of Arrangements at an early date.

The following are the Committee of Arrangement:

E. E. Montgomery, M. D., 1715 Walnut St., Philadelphia, *Chairman*; Isaac C. Gable, M. D., York; Geo. S. Hull, M. D., Chambersburg; John C. Davis, M. D., Carlisle; Henry Stewart, M. D. Gettysburg; Geo. Rice, M. D., McSherrystown; E. W. Cashman, M. D., York Springs.

### Improved Service to Cincinnati & St. Louis.

The Baltimore & Ohio Southwestern Limited, leaving Market Street 11.26 A. M., and the fast Express, leaving at 9.58 P. M., and leaving 24th and Chestnut Streets 11.42 A. M. and 10.15 P. M., for Cincinnati and St. Louis, are now equipped with a complete Dining Car service, built expressly for these trains by the Pullman Company. Pullman Dining Cars are also attached to Royal Blue Line trains leaving Market Street 11.26 A. M., 7.22 P. M., and leaving 24th and Chestnut Streets 11.42 A. M., 1.35 and 7.38 P. M. daily for Baltimore and Washington.

### Of Interest to Travelers.

The Baltimore and Ohio Railroad announces that they have placed on sale round trip tickets at reduced rates to the Winter Resorts in Florida and the South, and also to such points of interest as Luray, Natural Bridge and Gettysburg. This company has also arranged to place on sale excursion tickets to San Francisco and other points in California on account of the Mid-Winter Fair, at unusually low rates. Excursion tickets are now on sale to Baltimore and Washington via the famous Royal Blue Line.

With its vestibuled train service via Washington to Cincinnati, St. Louis and Chicago, the B. & O. is in the best of condition to handle western and southern travel. That the line is a popular one, is attested by the immense World's Fair business handled this summer.

Those contemplating a trip west or south this winter, should write to James Potter, Div. Pass. Agent, B. & O. R. R., 833 Chestnut St., Philadelphia, Pa., for rates and other information.

## WHY "MUMM" IS SO POPULAR WITH PHYSICIANS.

**HIGHEST AWARD FOR EXCELLENCE AND PURITY**
**RECEIVED AT COLUMBIAN WORLD'S FAIR FOR G. H. MUMM & CO.'S EXTRA DRY.**

G. H. MUMM & CO.'S EXTRA DRY is recommended for its purity, its small amount of Alcohol, and its wholesomeness by such eminent physicians as:

**Drs. Fordyce Barker, Lewis A. Sayre, Wm. H. Thompson,** *NEW YORK;* **Drs. D. Hayes Agnew, Thos. G. Morton, Wm. H. Pancoast,** *PHILADELPHIA;* **Alan P. Smith, H. P. C. Wilson,** *BALTIMORE;* **Drs. J. Mills Browne,** *Surgeon-General U S. Navy;* **John B. Hamilton,** *Supervising Surgeon-General, Marine Hospital Service;* **Wm. A. Hammond, Nathan S. Lincoln,** *WASHINGTON;* **Drs. H. Byford, Chr. Fenger, R. Jackson, C. T. Parkes, E. Schmidt,** *CHICAGO;* **Drs. A. C. Barnays, W. F. Kier, H. H. Mudd,** *ST. LOUIS;* **Drs. A. L. Carson, James T. Whittaker,** *CINCINNATI;* **Drs. Stanford E. C. Chaille, Joseph Jones, A. W. de Roaldes,** *NEW ORLEANS;* **Drs. C. B. Brigham, R. B. Cole Levi C. Lane, J. Rosenstirn,** *SAN FRANCISCO.*

"By chemical analysis the purest and most wholesome champagne."—
*R. Ogden Doremus, M. D., LL. D., Professor of Chemistry, N. Y.*

**NO OPENERS REQUIRED** in using G. H. Mumm & Co.'s Extra Dry in sick rooms and families.

According to statistics the importation of Mumm's Extra Dry from January 1st to November 1st, 1893, aggregates 60,641 cases, over one-fourth of the entire champagne importation, or 18,716 cases more than any other brand.

G. H. Mumm & Co.'s Extra Dry of the excellent 1889 vintage is attracting great attention for its natural dryness, purity and quality.

**FRED'K de BARY & CO., New York,**
**Sole Agents in the United States and Canada.**

## HOW TO FEED THE VERY SICK

Every physician is puzzled at times. Such food demands:

1. The minimum of bulk with the maximum of nutriment.
2. Easy digestibility.
3. Prompt assimilation. The problem is solved by

## RUDISCH'S BEEF PEPTONE

(SARCO PEPTONES)

It remains on the stomach when all other food is rejected.
It contains all the nutrition of the finest beef in a pre-digested, palatable and soluble form.
Equally good in hot or cold water for children or adults.
Great strength in small doses.

Please write for free samples and pamphlets mentioning THE MEDICAL AND SURGICAL REPORTER.

## ORIGINAL ARTICLES.

# THE RELATION OF DISEASE AND OF MORBID CONDITIONS OTHER THAN THOSE LOCATED IN THE EYE TO THE FORMATION OF CATARACT.*

G. E. de SCHWEINITZ, M. D.†

The etiology of cataract is by no means always clear, and independently of the studies which pertain to the pathological anatomy of opacity of the crystalline lens, much interest resides in the causes which may originate clouding of this structure. I omit entirely reference to the influence of age, sex, occupation, heredity, diseases of the eye, and accommodative strain, each and all of which are important factors, and desire to call attention to those cases which bear some relation to nutritive disturbances, in their turn dependent upon constitutional disease, or upon more localized extra-ocular conditions. It is evident that trustworthy information on this point could be obtained, were it the custom of general practitioners to make as careful examination of the transparent media and fundus of the eye as they do of other organs, in the study of the symptomatology of the cases of general disease which come under their care. In the absence of such systematic examinations, ophthalmic surgeons are forced to gather the evidence, except in a few instances, from reports scattered here and there through the literature, many of which are valueless, inasmuch as they prove nothing more than probable coincidence. Therefore this topic has been introduced for the consideration of a general medical society, hoping that it may stimulate research in this line. Doubtless useful data could be gathered were general practitioners and ophthalmologists—serving at the same time in large hospitals—to combine their efforts in the study of each case of constitutional disease from its beginning to its close. How much reliable information would thereby be added to the already large store of knowledge belonging to medical ophthalmology can only be imagined.

For convenience of study, I have arranged the cases in which disease bears some relation to the formation of cataract into:

### I. IDIOPATHIC FEVERS AND ALLIED DISEASES.

(*a*) *Typhus and Typhoid Fever.*—It is a matter of common observation that the clinical history of cataract formation will not infrequently reveal that the patient refers marked failure of sight to some decided febrile disturbance, but it is difficult to prove that this has positively been the cause of the depreciation in vision. For example, Galezowski[1] investigated 4776 cataracts with reference to their etiology, and attributed by far the greatest number —1528—to age, as they occurred between the sixtieth and the seventieth years.

*Read before the Philada. Co. Med. Soc., 1893.

†Clinical Professor of Ophthalmology, Jefferson Medical College; Professor of Ophthalmology, Philadelphia Polyclinic, etc.

1 "De l'Etiologie de la Cataracte," Recueil d'Ophth., p. 17, 1883.

therefore, the majority were representatives of a retrograde process in a changing organism. The remainder, exclusive of those which occured under the influence of injury and heredity, were ascribed to excesses, accommodative strain, and finally, to debility of the body as the result of constitutional and febrile illnesses—that is to say, this debility hastened the cataractous process.

A little more to the point, but none the less of indifferent value, are the observations of Trelat[2] on cataracts following typhoid fever, in which he describes double, semi-soft cataracts in a young girl which began to develop during convalescence from typhoid fever. Arens[3] examined two young people, brother and sister, who developed double cataract, which became total in one eye, after an attack of typhus fever. A good result after extraction was secured. Fontan[4] reports three cases of post-typhoid cataract (cataracta punctata) which he believes were the result of mechanical obstruction of the circulation. Two of these cases, one a twenty-eight-year-old man and the other a forty-two-year-old woman, progressed to maturity and required extraction. There is no evidence from this paper, however, than Fontan was aware of the condition of the transparent media before the typhoidal attack.

(*b*) *The Exanthemata.*—As the malnutrition of typhus and typhoid fever may perhaps be responsible for lenticular opacities, likewise this is true of the various exanthemata, quite independently of the fact that these diseases may cause local inflammatory conditions which would determine the opacification. Romiée,[5] for example, analyzed 44 cases of cataracta punctata, and attributed the pathogenic cause to typhoid fever 17 times, variola 7 times, and scarlet fever 3 times. Chlorosis was made responsible 7 times, and the remaining 10 instances were ascribed to diverse maladies—suppuration, heart disease, rachitis, etc. The author seeks to explain the lenticular opacities by an increase in the density of the serum and changes in the relation of the lens to the aqueous humor.

(*c*) *Whooping-cough.*—For the most part, the reports concerning the relation between whooping-cough and cataract formation are vague, as, for example, such indefinite cases as were reported in pre-ophthalmoscopic days by Wright,[6] who records the case of a baby, aged eighteen months which was able to see for twelve months, then had whooping-cough, and afterward cataract.

(*d*) *Malaria.*—Inasmuch as severe malarial fever of any type may be accompanied by lesions in the vitreous and the choroid—for example, hemorrhage, which after absorption leaves membranous opacities and areas of atrophic choroiditis—there is no reason why cataract should not form. A more direct connection than this seems doubtful. Bagot,[7] however, describes two cases in mulattoes who, directly at the close of a violent malarial illness, suffered from diminution of visual acuity, and a few months later double soft cataract was evident. After operative interference the visual acuity returned to normal, and there were no lesions in the fundus oculi.

(*e*) *Epidemic Influenza.*—During the prevalence of epidemic influenza, or la grippe, so fresh in the minds of all of us, a large amount of attention was directed to the ocular lesions, and a great variety of affections, inflammatory and otherwise, which occurred in the eyes of the sufferers were attributed, and no doubt in many instances rightly, to the influence of this extraordinary disease. It would be out of place to attempt a review of the literature, which is very considerable, but as an example of what was observed, I may quote a single analysis, namely, that of Rampoldi.[8] Among 532 eye patients whom he saw during the months of February and March, 1890, there were 48 who had acquired their ocular trouble during or after an attack of influenza. These affections were acute conjunctivitis, conjunctival abscess, abrasion of the corneal epithelium, corneal infiltrations, corneal abscess, iridocyclitis, serpent ulcer, serous iritis, choroiditis, detachment of the retina, and affections pertaining to the external and internal ocular muscles.

4 Rec. d'Ophth., 3 serie, 9, 1887.

5 Journal de Med. de Bruxelles, 1873, quoted by Fontan, loc. cit.

6 Western Med. and Phys. Journ., Cincinnati, 1827-28, 1, 428-431.

7 Annales d'Oculistique, November, 1891, tome cvi. p. 338.

8 Ann. di Ottalm., vol. xix., 1, p. 70. Abstract, Archives of Ophthalmology, vol. xx. p. 295.

Therefore, it is not unlikely that this disease, producing such serious inflammatory lesions, may be followed by cataract, and this probably is the explanation of such cases as have been reported.

One case of several occuring in my practice may be quoted: Private patient, female, aged fifty-five years, applied for treatment on the 25th of July, 1891; in good health except during the winters of '90 and '91, when she had sharp attacks of la grippe. Following these, vision began to fail, associated with a dull, aching pain in the eyes. In the right eye there were large striæ in the lens down and in; the optic disk a vertical oval, of good color, but with undue broadening of the scleral ring. In the left eye large punctate opacities in the posterior cortical and also in the vitreous. No hemorrhages in the eye-grounds. Previous to these attacks of la grippe the media were clear. Now it is very evident that one of the common lesions of influenza was present in this patient, namely, vitreous disease, which in its turn was no doubt responsible for the formation of cataract that has since gone on to maturity in the left eye.

II. CONSTITUTIONAL DISEASE.

(*a*) *Gout.*—This ubiquitous disease has been made responsible for a great variety of ocular affections, and, naturally, cataract has not escaped. Zychon[9] contributes an article upon the influence of gout in ophthalmic disorders. Michel, who abstracts the article in the *Jahresbericht f. Ophthalmologie*, vol. xvi, p. 318, somewhat sarcastically states: "We know from Zychon's teacher, Galezowski, that gout has been made responsible for all possible and impossible eye diseases, and so we are not surprised when to the list of gouty ocular affections the following are added: lithiasis of the lids, dry eczema, subconjunctival ecchymosis, conjunctivitis, calcareous degeneration of Bowman's membrane, scleritis and iritis, choroiditis and cyclitis, retinitis and choroido-retinitis, *cataract*, glaucoma, arterial thromboses, muscular palsies, and, finally, migraine." Now, in spite of Michel's unnecessary criticism of this author, many of these affections are undoubtedly gouty, and because the uveal tract falls under its baleful influence cataract may be indirectly caused by this disease, but not, however, without the intervention of inflammatory lesions, which attack those portions of the eye particularly concerned in the nutrition of the crystalline lens.

(*b*) *Rachitis.*—Punctate cataract—if the report of Romiée[1] may be credited—sometimes occurs in connection with rachitis, and Nicati[2] brings the total cataracts (not congenital) which are sometimes found in children into etiological relationship with rachitis.

One form of cataract, variously called zonular or lamellar, which anatomically consists of a narrow zone of degenerative change in the lens fibres situated between the nuclear and cortical areas, has often been attributed to rachitis. The true cause, however, is not certainly known. The congenital variety is probably due to some developmental defect; in the form arising in early infancy some fault in nutrition has occured; most often the subjects are rachitic and present the teeth and cranial asymmetry peculiar to this affection. A history of convulsions is common, and the dental defects which are present in the form of lines, furrows or terraces, running transversely across the incisors or canines, are considered by Hutchinson tobe due to the mercury which in all probability was given for the convulsions, which in their turn caused the cataract. Therefore, the cause does not reside in rachitis itself, but in the frequent, severe, and long-continued convulsions to which its subjects are liable. Moreover, as Knies,[3] quoting Arlt, points out, the cause does not pertain alone to the general convulsions, but to the disturbance of the lens brought about by the severe ciliary muscle-cramp which is said to be present in all universal convulsive affections. Such a result can obtain, however, only in the earlier years of life, while the process of development in the lens is still an active one.

(*c*) *Constitutional Syphilis.*—This disease, like other affections which are prone to attack the uveal tract, is not infrequently followed by secondary cataract as the result of disturbance in the nutritive processes of the eye. Some authors,

2 "Cataractes et Lesions dentaires des Rachitiques," Abstract, Jahresbericht f. Ophthalmologie, 1879, vol. x. p. 341.

3 Die Beziehungen des Sehorgans und senier Erkrankungen zu de ubrigen Krankheiten des Korpers und seiner Organe. Wiesbaden, 1893, p. 467.

however, have described so-called true syphilitic cataract. For example Bos[4] records several examples from Badal's clinic, and refers to others which have been seen by Heller[5] and Romiée.[6] He divides these cases into two classes: 1. Capsular cataracts which are associated with iritis, etc.; 2. Lenticular or true cataracts, which are rare and directly due to syphilis. They are soft and appear in the second period of this disease, presumably without the intervention of inflammatory processes in the ocular coats.

(*d*) *Diabetes.*—The usual answer to the question "What is the most frequent ocular lesion in diabetes," is "cataract." Ever since the observations of France,[7] in England, and the still earlier ones of Mackenzie and Duncan, as well as those of Von Graefe, to the present time, an enormous literature has accumulated with reference to the relation of saccharine diabetes to the formation of cataract, and its influence upon operative interference in this disease. It has become the rule to examine the urine carefully for sugar in all cases of cataract, especially when it develops in young subjects, and it is well known that in fully 1 per cent. of the cases sugar will be detected, and, moreover, that the cataractous lenses of patients the subject of diabetes mellitus occasionally contain sugar. From the experimental standpoint, especially the researches of Mitchell and Deutschmann, it is known that the injection of large quantities of salt or syrup into the tissues of the lower animals may cause opacity of the lens, the result probably of the extraction of water from the lens and interference with its nutrition. We also have in evidence the occasional spontaneous disappearance of diabetic cataract, in some instances corresponding with a diminution of the amount of sugar in the urine. Knies thus summarizes the various theories which have been brought forward to explain the connection between diabetes and cataract.

It may result from : 1. A general marasmus. The objection to this hypothesis is that in very high grades of depraved nutrition occurring in diabetes quite frequently there is no cataract. 2. The abstraction of water from the lens by means of the sugar in the tissues, which, in fact, very frequently, if not as a rule, is found in the lens, and more often in the aqueous humor and the vitreous. If this were true, however, after a time all diabetes should suffer from cataract, which is not the case. Besides, as Leber has shown, both the opaque and the clear lens may contain sugar in diabetic patients, and Becker has described cases in which in one eye the cataractous lens contained sugar and in the other it did not. 3. Finally, is the theory that the sugar contained in the aqueous chamber undergoes a change into lactic acid, which in its turn causes the cataract. This theory has no foundation, inasmuch as the aqueous humor is alkaline, even though there be diabetic cataract, and, in the second place, the opacity does not begin in the anterior cortical portions of the lens.

Touching the pathology of this affection, and throwing some light upon the relationship between the disorders, Deutschmann[8] examined four cases of diabetic cataract, finding proliferation of the layer of pigment cells on the posterior surface of the iris, a condition which had previously been described by Becker. In the lens were vesicular cells (blasenzellen) and all the changes from normal nuclei to complete nuclear disintegration. Deutschmann concludes that the opacity in the lens is due to a necrotic tendency of the epithelial structures, just as the same tendency is shown by all epithelial tissues in this disease. If the epithelium is normal no pathological process of diffusion takes place, no matter if both vitreous and aqueous contain sugar, but when necrosis of the lenticular cells occurs abnormal diffusion currents are set up and produce opacity. Referring to these researches, and others like them, Knies points out that in certain cases the iris is more or less changed—sometimes atrophic, sometimes slightly inflamed—in other words, uveal tract inflammations may be present in diabetes. The development of cataract, then, belongs not so much to the presence of sugar, but is an intoxication symptom—a species of auto-infection.

The relationship between diabetes and the formation of cataract, which has been accepted for many years, has recently been questioned in a publication of Mauth-

4 "Des Cataractes syphilitiques." These de Bordeaux, 1884.

5 Wien. med. Wochenschr., 1877, p. 559.

6 Loc. cit.

8 Graefe's Archiv. xxxiii., Abth. 2, p. 229.

ner's.[1] His study includes a large number of cases seen in Carlsbad. An editorial published in the *Medical News*, March 18, 1893, reviews this paper and from it I extract the following quotation as pertinent to the subject: "In most of the cases in which defects of vision were found, these could be as readily attributed to concomitant conditions, such as age, impaired nutrition, and other intrinsic influences. The number of cases of diabetes mellitus in which cataract exists will, at best, be found to be exceedingly small. It is pointed out that the peripheral striation of the lens sometimes found in diabetes, and especially in the inferior median quadrant, is quite common, and becomes progressively more frequent in individuals that have passed the fiftieth year of life. Among the influences that might be considered as favorable to the development of cataract are: The displacement of water in the fluids and tissues of the body by the presence of sugar; a diminution in the resistance of the walls of the bloodvessels as a result of the pathological metabolism, of toxic substances that give rise to inflammation and degeneration; the marked marasmus; complicating or intercurrent affections. If the ocular changes were due to the loss of water, they should likewise occur in simple polyuria. It is more than doubtful that opacities of the lens result from the presence of sugar, for there is evidence that the lens normally contains sugar. The development of cataract in an elderly person whose urine contains sugar does not constitute sufficient ground on which to make glycosuria responsible for the loss of transparency of the lens, for it is known that in the large majority of cases of senile cataract the urine does not contain sugar. The conclusion is reached that the presence of sugar in the fluids of the eye does not lead to any disease of the organ of vision, and especially not to the development of cataract. In a small percentage of cases of diabetes mellitus, however, the excessive elimination of sugar and of water does lead to the development of cataract."

### III. Local Diseases.

(*a*) *Diseases of the Heart and Atheroma of the Vessels.*—From time to time diseases of the heart and of the bloodvessels have been brought forward to explain the existence of cataract. One of the earliest communications on this subject is a report, by Furneaux Jordan,[2] on the relation of cataract to heart disease. Nineteen cases are reported: 2 under twenty years of age, 7 between forty and fifty, 5 between sixty and seventy, and 5 past the seventieth year. These patients suffered from various forms of organic cardiac lesion and had cataract. Other than this, no relationship was demonstrated; but, as will be noticed, the majority of the cases were at that time of life when cataract is likely to occur in the absence of constitutional disorder. The cases, however, are quoted for the reason that it was an attempt to gain some information in regard to the etiology of cataract, and, as has been observed in other cases, there is an occasional relationship indicating that vascular disturbances are in some way responsible for opacification in the lens. Romiée (*loc. cit.*) ascribes several cases of cataracta punctata to heart disease.

A more modern view of a somewhat analogous relationship is the theory of Michel, that circulatory disturbances, and particularly atheroma of the carotid, may be responsible for the formation of cataract. Michel[3] came to the conclusion that opacity in the lens substance was a symptom of a local or general disturbance, and that so-called senile cataract depended upon sclerotic changes in the walls of the carotid. He analyzed 53 cases: in 14 of them there was monocular cataract, with atheroma of the carotid on the same side; in 14 there was double cataract which was more developed and had begun earlier on the side of the greater atheroma; in 9 cases of double cataract these had developed simultaneously with a double carotid atheroma; and in 8 cases of cataract there was sclerotic change in the carotid, and on the same side the presence of a swelling in the thyroid gland, or goitre.

Other observations on the same subject have been brought forward, for example,

1 "Amblyopia Diabetica," Internationale klin. Rundschau, 1893, Nos. 6, 7, 9, 11, 16, 24, and 25. Abstract, Centralbl f. prakt. Augenheilk., August, 1893.

2 British and Foreign Medico-Chirurgical Review, 1857, vol. xix. p. 484.

3 "Ueber den Zusammenhang von ocularen Storungen mit Storungen im Circulationsgebiete des Carotis," Sitzungsber d. physik. med. Ges. zu Wurzburg, 1881, Nr. 6. And "Das Verhalten des Auges bei Storungen im Circulationsgebiete der Carotis," Festschrift zu Ehren Prof. Horner's, 1881; S. 1. Abstract, Nagel's Jahresbericht, vol. xii. p. 323.

in the thesis of Karwat[1], which adds a series of cases confirming those already reported by Michel, viz., that there is a relationship between atheroma of the carotid and the formation of cataract.

On the other hand, Becker,[2] with the help of Adolf Weil, investigated 53 cataract cases, among whom disease of the carotid was evident in only 16 ; in 37 it was not present. Among the 16 were 6 persons with atheroma more developed on the side of the lens first affected ; in 10 cases this was not the sequence of events. Moreover, this was found only in individuals who had passed the fortieth year. In all four cases of one-sided cataract the condition of the circulation in general, and especially of the carotid, was normal.

(*b*) *Nephritis.*—Naturally, the various types of so-called Bright's disease, and the widespread lesions which they may produce throughout the body, have been brought into connection with the formation of cataract. Deutschmann,[3] after reporting 21 cases of lenticular opacity in which he had found albumin seven times, and six times established the presence of nephritis, called attention to the possibility of a connection between the two diseases. Still later, in 1881, the same observer[4] found among 53 cataract patients 9½ per cent. cases of Bright's disease, and again refers to the relationship between albuminuria and the development of lenticular opacities, quoting Becker, who had in a communication disputed his conclusions, and yet found from 12 to 18 per cent. of the cases suffering from albuminuria. In still a later communication Deutschmann[5] reports the examination of 230 patients with uncomplicated cataract, among whom 5 per cent. were undoubtedly nephritic, and 11.1 per cent. probably affected with Bright's disease.

This communication was followed by one from the pen of Landesberg,[6] who describes the examination of 376 patients with uncomplicated lenticular opacity, finding sugar alone in the urine of 3 of them, sugar and albumin in 2, and albumin in 44—therefore 327 with normal urinary analysis and 49 abnormal—and concludes very properly that albumin and cataract may be associated as a coincidence, but that the presence of albumin does not necessarily mean the existence of Bright's disease.

In 1886 Rothziegel[7] found albumin in more than half of his cases, and attributed this large percentage to the fact that he examined them at many intervals during the day. He describes 15 cases of chronic nephritis with cataract, and comments upon the arterial lesions which may be present, and particularly atheroma of the carotid.

Finally, I may refer to the researches in 1887 of Evetzky,[8] who, desiring to investigate the trustworthiness of Deutschmann's albuminuria theory, divided his methods into three portions: 1. He examined 200 cataract cases for albumin. Of these, 35 were under fifty and 165 older than fifty. In 38 he found albumin—that is, in 19 per cent. of the cases. In 16 cases the albumin was a constant feature, and in 9 per cent. there were albumin and tube casts, and these usually in cases under fifty years of age. 2. He examined 97 cases of chronic nephritis, 70 under fifty and 27 older, and found the following eye-complications: albuminuric retinitis, cataract, posterior synechia, opacities in the vitreous, detached retina and synchisis scintillans. Cataract, always incipient, was found in 8 cases, or 8.2 per cent., and 1 of these was an anterior polar cataract which had existed for many years, while 7 of the cases were in old people. 3. He examined 584 old people with the ophthalmoscope, and found 204, or 45.2 per cent., with cataracts, usually incipient. Of these there were 2.09 per cent., in the sixth decade, 43.75 per cent. in the seventh decade, 52.6 in the eighth decade, and 66.6 per cent. in the ninth decade. Their urine was examined, and in 59 cases, or 10.5 per cent., albumin was found, and in 1.6 per cent. tube casts. Of the cataract cases 10.5 per cent. showed albumin; of the non-cataractous cases 9.8 per cent. True nephritis was found among the cataractous patients in 0.8 per cent. of the cases, and 2.1 per cent. of the non-cataractous patients. Therefore, he concludes that

albumin does not mean nephritis; that nephritis and cataract may combine; that in young nephritics there is no cataract, and in old ones not more usually than in those who are without the signs of Bright's disease.

Thus it will be seen that while it is of the utmost importance, both in determining the prognosis of the affection and also that of operative interference, to examine the urine of every cataract patient, and while albumin and sometimes tube casts may be found, no causal relation has been positively established between nephritis and cataract.

(*c*) *Nervous Diseases.*—We have already determined that zonular cataract, which has been found in association with rachitis, is more likely due to convulsions, or to local cramp in the ciliary muscle, than to the disease itself. In like manner, those examples which have been found in connection with other complaints, more particularly belonging to lesions of the nervous system, for example, epilepsy are explainable by the presence of convulsive disturbances. Thus, Logetschnikow[1] describes 15 cases between the ages of sixteen and thirty-seven, who suffered from general clonic convulsions and developed total cataract. Their vision had been good, with the exception of one case, before these nervous phenomena manifested themselves. He discusses the possibilities of other causes for cataract and practically eliminates them, and concludes that the development of cataract is in relationship not alone with the convulsive seizures, but with the nervous lesion which is the basis of the convulsive efforts.

Meningitis has been responsible for the formation of cataract in young individuals. Bock[2] has reported 5 cases between the ages of thirty-four and thirty-nine who suffered from cataract, underwent an operation, and secured good vision. He excluded other causes of lenticular opacity except the likelihood that the disease followed the meningitis from which they suffered. Examination of the eyegrounds seemed to show that two may have had optic neuritis, but none the less they did well after operation. There were no convulsions.

Sewill[3] reports an interesting case of orbicularis spasm on the right side of the face and the development of cataract. The spasm was caused by a carious tooth and ceased on its removal. He refers to trophic changes in connection with the trigeminal ganglion as a possible explanation of these phenomena.

(*d*) *Diseases of the Skin.*—Mooren, quoted by Norris, asserts that chronic skin eruptions may favor the development of cataract by causing creeping inflammatory processes within the eye, and Förster believes that it is not impossible that chronic skin affections may favor to the development of a depraved nutrition, which in its turn produces cataract by alterations in the nutrition of the lens.

Rothmund[4] describes an unnamed exanthem, the pathological anatomy of which was a chronic parenchymatous inflammation of the skin, the papillary layer and rete Malpighii being chiefly affected, which appeared in a number of children and was associated with the development of lenticular opacity. This began between the fourth and sixth years, although the safffikenction was manifested between the our th and sixth months. The cataract commenced in stripes, but quickly developed and became complete in several days. This skin affection was compared with vitiligo, keloid, and ichthyosis, but had sufficient individual peculiarities to separate it from each of them. No good explanation was given of the cause of the opacity, except, perhaps, that the chronic parenchymatous inflammation of the skin was associated with an analogous condition of the lens.

Nieden[5] has described the case of a girl, aged twenty-two years, who developed cataract rapidly, the opacity being preceded by a teleangiectatic swelling of the capillaries of the face. Referring to the well-known relation of diseases of the uveal tract to the development of cataract, and to the relation of atheroma to its production, he thinks the dilated capillaries may have been an indication of a vascular disturbance within the cranial cavity which was responsible for the passage of the lens into opacity.

IV. TOXÆMIAS.

Although, perhaps, not belonging strictly to the list which I have discussed, it would seem, in closing, proper to refer to one or two forms of cataract which have developed, if not under the influence of, at least in association with, the action of certain drugs. Foremost among these are the observations which relate to the development of opacity of the crystalline lens in connection with ergotism, or, as it is often called, the formation of raphanic cataract.

Thus Meier[1] observed 23 cases of ergotism, 15 females and eight males. Their ages were between ten and sixty, the poisoning lasted from six weeks to three months, and the chief symptoms were cramps and convulsions. He attributed the disease either to the action of ergot on the ciliary nerves, or to the convulsive disorder. Numerous papers have appeared upon this subject, to which further reference is unnecessary, except to say that, as, for example, in those cases reported by Tepljaschin,[2] 27 in number, occurring during an epidemic of ergotism, and for the most part under thirty years of age, the development of the cataract was ascribed rather to the convulsive disorder than to any distinct action of the poison itself. Hence it seems proven that the lenticular opacity results from the violent general convulsions and not directly from the ergot.

Among other toxic agents that are known to cause cataract is naphthalin. Experimentally, cataract has been produced with this drug by feeding it to rabbits, but it should be mentioned that, in addition to the lenticular opacity, there are general disturbances as well as changes in the retina and vitreous. Other drugs and toxic agents have in a vague way been suggested as a possible cause of opacities in the crystalline lens, but it is likely that these relationships have existed in the minds of the patients rather than in reality, and before they can be accepted, direct experimentation, especially upon the lower animals, will be required.

Naturally the possible relationship between cataract and general disease has often been discussed, but, as may be seen from the cases quoted this evening, the conclusion reached by Becker,[3] that a connecting link between constitutional malladies and opacity of the crystalline lens has not been established, remains in a large measure unshaken. To quote again from this author: "The influence of the constitutional condition of the organism expresses itself relative to the lens, either that another portion of both eyes first becomes diseased and the pathological changes brought about in the vitreous through this means lead to the formation of cataract, or that the lymph of the body experiences changes, through which, without the evident intervention of other ocular lesions, lenticular opacity develops." None the less, as pointed out in the beginning of this paper, systematic examination of cases of general disease, especially frequent investigation of the transparent media, throw further light upon this subject, and is a research worthy of followers.

The evident influences of eye-strain and asthenopia in its widest sense, together with the changes which this produces in the ocular coats, particularly the choroid, referred to by Schoen and more recently elaborated by Risley, on the formation of cataract is well established. Possibly constitutional diseases permit this influence to be more strongly felt, and thus indirectly aid in the development of lenticular opacities, or, perhaps, a more direct influence can be established. Be this as it may, further critical evidence is needed.

THE primordial lesion in neurasthenia, "according to Bouchard," is dilatation of the stomach. This condition he claims exists to a greater or less degree in all neurasthenics.

# COMMUNICATIONS.

## EXTERNAL URETHROTOMY FOLLOWED BY SEPTIC ARTHRITIS.*

E. D. FENNER, M. D., New Orleans, La.

The case which I propose to present to you to-night is in truth one upon which an external urethrotomy has been performed, but the operation itself has been completely overshadowed by the complications that ensued. I lay it before you not to serve as a text for any discussion of septic arthritis, but simply as an example of the severe and unexpected results that sometimes follow an apparently simple and favorable operation. For many of the data I am indebted to Mr. Lovell, R. S. of the ward. John Henry, aged 21, was admitted to No. 2 on June 25, 1893, suffering from urethral stricture. He passed his urine with straining and in a very small stream. This he had noticed three months before, but it had grown progressively worse. As is frequently the case with negro subjects, he denied any previous venereal trouble. On June 27 a filiform was inserted with the intention of passing a Goulé sound. The whalebone was old and defective, and, slipping from the grasp of the assistant who held it was doubled upon itself by the sound and broke off in the urethra.

External urethrotomy was now done, the whalebone extracted (a portion of it was fortunately still in the urethra) and the whole canal was dilated with steel sounds. Considerable traumatism was inflicted upon the penile portion in this operation.

The patient was put to bed and in the evening his temperature was 101 deg. From that time till July 5 the temperature ranged between 99 and 100 deg., when on the morning of the 5th it rose to 103 deg. From that time till the 16th it remained very high but irregular, owing to the use of antipyretics. On the 8th the thermometer registered 105½ deg.; on the 11th it was again above 105 deg. These were the highest records. On July the 16th he was transferred to a medical ward, on the suspicion of typhoid fever.

From the day after operation he complained of pain in the urethra and perineum, but no sign of a phlegmon could be discovered and the urine was only slightly tinged with mucus. With the advent of the high fever came intense lumbar pain, with some tympanites and tenderness over abdomen.

He remained in the medical ward for thirteen days, during which there developed an arthritis of the left wrist, and of the right knee and elbow. His temperature now ranged between 99 and 102 deg., generally being about 100 deg. His condition was one of general sepsis. Abscesses formed and were opened on the shin below the inflamed knee, and in the axillæ. From the right elbow and knee fluid was removed with the aspirator, in which was found a considerable amount of pus. The joints were immobilized with plaster casts, and in the case of the knee an ice bag was kept on for three days, before the plaster was applied.

In addition to these serious joint troubles, on August 10 a profuse watery diarrhœa commenced and continued till the 23rd, when it was finally checked by the lead and opium pill, having been uninfluenced by mixtures of bismuth, salol and chalk. From August 23 the man began steadily to improve. The swollen joints subsided, temperature seldom rose above 99 deg., appetite returned, and on September 1 he got up and has since been able to sit up during the day.

Of course, during this time the urethra has been left to itself; at no time has the man been in a condition to stand the passage of a sound, but some urine passed by the meatus, and before long I hope to be able to pass an instrument and restore the canal. Throughout the case the treatment has been symptomatic. Fever was combated with quinine and phenacetine, and with sponging.

The joints were put at complete rest by means of immovable splints. In the case of the knee a considerable amount of fluid was withdrawn by the aspirator and the ice bag applied for several days.

While still weak and not entirely over the arthritis, the patient is rapidly improving, and we hope will yet recover entirely.

*Read before Orleans Parish Medical Society, August 9, 1893.

# SOCIETY REPORTS.

## ORLEANS PARISH MEDICAL SOCIETY.

*Meeting October 14, 1893.*

Dr. Martin read his paper on

LONG CONTINUED FEVERS IN LOUISIANA.

My desire this evening is to prompt a discussion on a subject which, though not entirely new to the society, is, I believe, most deserving of consideration. I have had to cope recently with a type of fever foreign to any represented in our text books. From older practitioners I learn that these slow fevers of Louisiana, which resist all forms of treatment, and which are sometimes more aggravated than benefited by quinine, are of recent origin in this State. With the many forms of malarial fever we are thoroughly conversant, though it is my belief that the prefix "malaria" is too often used to supply a want in the absence of a diagnosis. In my own brief experience I have known a case of abscess of the liver to have been diagnosed and treated for six weeks as one of malarial remittent fever. Also, a case of pelvic cellulitis, notwithstanding the local pain, was diagnosed as malaria. In such cases, however, a correct solution of the case is generally arrived at before any serious trouble arises. But an error of this kind in the diagnosis of typhoid fever would, at least in my hands, prove fatal. We should bear in mind that, notwithstanding the teachings of our professors, typhoid fever does exist in this community, and to such an extent that it is time for us to eradicate from our minds old prejudices so thoroughly instilled in past years, for there can no longer be a doubt of its existence, and to the extent that we should be prepared to meet it at any time.

Is it not possible that many of the so-called cases of typhomalaria are modified forms of typhoid? May not climatic influences moderate the diseases, for certain it is that few, if any, typical cases have ever originated in our city. Malarial and typhoid fevers are distinct forms and easily diagnosed, making the treatment clear. But another form of continued fever exists, so different in its origin, its symptoms and its cause from either of these two forms that I have deemed it my duty to introduce the subject here to-night and to ask the members of this society to give the matter their time and consideration. This fever, so I have observed, is usually ushered in without any premonitory symptoms. The patient usually complains of feeling dull; the tongue may or may not be coated; the bowels costive; loss of appetite; sometimes nausea and slight elevation of temperature; seldom any functional disturbance. The temperature will vary from 99 degrees to 103 degrees, and the fever will continue from three to nine weeks. Patients are not greatly exhausted by the fever and are sometimes able to keep about their work. One case which I had under treatment, a robust person, was never compelled to lie down during the day, but spent the time in a large arm-chair. The fever lasted ten weeks. In this case, I believe its long continuance was partly due to malnutrition. Nausea complicated the treatment, and the question of treatment became a serious problem, until I had recourse to raw eggs and sherry; this constituted the nourishment during the day, the patient taking as many as half a dozen eggs in twelve hours. At night I gave mulled milk, which proved a soothing and nutritious beverage. Through the entire course of her illness I was at a lost to detect any one symptom sufficiently marked to point to a diagnosis. If malarial, it was not typical in appearance.

For some time I was inclined to believe it septic, but a most careful examination of every organ in the body, repeated several times, failed to substantiate this belief, As regards treatment, I have employed every form known to science without success. Quinine is inert, and antipyretics give but temporary relief. The case will run its course and must be treated symptomatically. My method of managing these cases has always been purely symptomatic, not expectant—relieve pain,

regulate the bowels, reduce the temperature, tempt the appetite and trust to luck.

If there are any present whose misfortune it has been to meet with such cases, I trust the results have been more gratifying, and that they have settled upon a diagnosis and a formulated plan of treatment.

I have prepared to-night, to present for your consideration, a number of charts showing the course of the various forms of continued fevers rather than monopolize your time with a detailed account of these cases. I will now submit these charts, which I have borrowed from the New Orleans Sanitarium, believing they will prove of some interest.

DISCUSSION.

After Dr. Martin had read his paper he presented charts representing the three types of fevers of which he had spoken—malarial, typhoid, and the particular type of remittent fever of which he had just spoken, which he said some of his confreres of the country called "slow fever." After the charts had been examined by the gentlemen present Dr. Martin said that as the subject of typhoid fever had been brought up at the last meeting, he had with him a chart of a typhoid case, regarding which he did not think it amiss to say something. The patient had been brought from Lutcher, a saw-mill town some distance above New Orleans. Was taken sick ten days before being brought to the Charity Hospital, where he was received May 21, and the case diagnosed as remittent fever. On May 27th he was admitted to the sanitarium. Up to that time had been taking quinine, and did so after the case was diagnosed as typhoid fever. He became delirious on the 28th and remained so for ten days. Pulse was very rapid and there were marked sordes, a thing you do not often see in remittent fever. Bowels very loose, with bloody stools. The treatment was symptomatic. A little antifebrine was given in whiskey to reduce the temperature—given in simple powder it distressed the patient too much. Strychnine was given as a tonic—that was really the treatment all the way through—antipyretics and strychnine, and he was kept on a milk diet. I believe, too, some ten drops of hydrochloric acid were given three times a day. Hemorrhages were treated with injections of laudanum, which seemed to have a good effect.

Dr. Lowe (in the chair) referred to the importance of the matter and said he hoped every member of the society would have something to say on the subject, and called upon Dr. Sexton to open the discussion.

Dr. Sexton said: Dr. Martin has presented a very interesting subject at a very opportune time. The long continued fevers are on the increase in New Orleans, and every practitioner has more or less of such cases to deal with throughout the entire year. When a student at college I remember that Dr. Bemiss in discussing this subject taught us that two separate and distinct poisons or morbid processes might exist in the system at the same time, each one modifying the other in its clinical history, so as to make a hybrid disease which was neither clear-cut malaria nor the classical typhoid of the older authors. During my practice in Mississippi, as well as in New Orleans, I have had considerable to do with these long continued fevers or the so-called typho-malaria of Wood. I have always considered it a mixed poison of the malarial element, whatever that may be, plus some septic infection.

The majority of cases coming under my observation presented a mixed clinical history, the malarial element of every other day exacerbations, while the septic and enteric symptoms were overshadowed or masked by the more powerful malarial poison. In other cases just the reverse was true.

In my experience with disease I have noticed that real, clear-cut diagnosis or typical symptoms of typhoid are the exception and not the rule. In a considerable experience with typhoid fever, I hardly recall a single case in which all the symptoms of the older writers on typhoid fever are to be found. Either the tongue does not present the characteristic symptoms, or diarrhœa or petechial spots are absent.

May it not also be true that malaria may become modified by the hygenic surroundings and changed conditions of the development of our city? If we were all practical microcopists when such cases come under our care, before beginning the treatment we should examine the blood for Laveran's plasmoidum malarial bodies, which being found (if they are the real cause of malaria), would clearly indi-

cate an anti-malarial course of treatment, which would be quite different if we should find the Eberth's bacillus. But whether these microscopic changes or bacilli are the causes or the results of the disease is not clear, at least to some of us.

I have often been puzzled in trying to think out the etiological process of this disease. Investigators tell us that one case of typhoid fever must originate from another, that the dejecta and infected water play the principal part in the spread of typhoid fever, so just how to account for the typhoid condition in these long continued fevers having no connection whatever with other cases of fever has been very puzzling to me. Not more so, however, than the resistance of these fevers to the action of quinine, though they possessed a distinctive intermittent clinical history—better one day and worse the next. That the fever has a malarial element in it is proven by the fact that it is most prevalent in malarial districts with every-other-day exacerbations. I have always considered it a non-contagious disease, having seen numerous cases where only one member of a large family has been affected with it. In its morbid anatomy it partakes both of the nature of typhoid and malarial fever. In substantiation of the fact that it is malarial fever, plus some other septic infection, I will call the attention of the society to the fact that it is most frequently found where such unhygienic conditions as over-crowding, bad ventilation, sewer gas, bad food and fruits from the market are used. In our city practice, perhaps, sewer gas more often represents the plus element in the etiology of the fever than any other of the causes mentioned.

With regard to its treatment I have usually met symptoms as they arose. Constipation in the beginning of the fever is the rule; to combat this I give from two and one-half to five grains each of calomel and soda at bedtime, providing the patient has never been salivated. In this event I use phosphate of soda, cascara sagrada or some vegetable pill. Later on in the disease I am more cautious about the use of purgatives, and have found good results by flushing out the bowels with antiseptic douches. Pyrexia has to be combatted, and I have usually accomplished this by sponging with tepid or cold water, rolling in wet pack and giving freely of cold water both by mouth and rectum, if agreeable to the patient. When the fever is high I usually keep the head enveloped in ice towels. An admirable diaphoretic mixture is made up of tincture of aconite, spirits of nitre and syrup of squills. More recent remedies for pyrexia belong to the coal tar group, one of which is about as efficacious as the other. I only give such remedies when the temperature is high, usually combining them with a toddy, and not repeating very often.

For the tonic effect of the quinine I usually give three capsules daily, combined with acetanalide or phenacetine to prevent disagreeable head symptoms and to meet the neuralgic element in the disease. I place more dependence on the sponging and cold baths, however, than any internal medication.

Large doses of quinine, while they may act as an antipyretic, will not abort the fever, and are damaging to the nervous system, hence should not be tried. As an intestinal antiseptic I use the emulsions of turpentine with salol or salicylate of bismuth; camphorated tincture of opium is added if there is exhausting diarrhœa. Internal hemorrhage are best controlled by some preparation of opium, and the ice bag. I have had good results from phospho-muriate of quinine compounded with arsenic, as a general tonic, repeated four or five times daily.

Dieting is very important, and should be confined to milk, broths, soups and gruel, nourishing in quality, small in quantity, often repeated. Under this plan of treatment I had perhaps a mortality of about 4 per cent. in the treatment of a large number of cases.

Dr. Dupaquier: It is much to be regretted that the discussion is based on mere conjectures, as we have no record of investigations on the bacteriology and anatomo-pathology of these fevers, the only positive means of determining their nature. But think of the technical difficulties attending these researches. The clinical, like the pathological phase, is undetermined.

The long-continued fever of Louisiana has no definite type; it appears to be *sui generis*.

If it is typhoid, it is very much disfigured, and to make out the diagnosis of that erratic typhoid, I think that the nervous symptoms are of great help (see *Bull.*

*de l'Academie de Med.*, Paris, 5 Sept., 1893, and *Gaz. Hebdom.*, Sept. 30., 1893.)

If it is malaria, it is again a very modified form, as it resists quinine.

Probably a secondary infection, due to gastro-enteric ptomaines, alters the character of the malarial fever, like secondary infection due to the streptococcus alters la grippe and creates the typhoid form of la grippe (see *Bull Soc. de Medicine,* Paris 21, Juillet, 1893). A sure thing is that the influence of climate upon disease is a strong factor (see Dutroleau and Laveran), and most probably in our climate both the universal typhoid and malarial poisons exhibit themselves under the peculiar forms of fevers now under discussion.

Dr. Chaissaignac: I wish first, when it comes to a question of fact, to record my experience in rather a different way from that of Dr. Sexton. I have very frequently seen here in New Orleans typical cases of intermittent fever, either of the quotidian, the tertian, or even the quatran type. I have seen them very clear cut, and in people who had not been out of the city at all; who had marked chill, and had it come back the next day, or the day after, at the same hour. Again neither of these cases has any connection with the other form of the fever of which the doctor states it is his experience that it occurs where the hygienic surroundings are poor and the food bad. I have seen these cases in some of the best families in the city—people who live well, who are cleanly, and whose houses are good and well ventilated and not troubled by any sewage.

Now when it comes to the discussion of this long continued fever, I think we want to decide first what we want to call typhoid fever. Many of us have seen cases that had been recognized as only simple continued fevers, so called, as far as the symptoms were concerned, including the range of the temperature, and having nothing of all typical of typhoid fever, when the patient died, as in some cases I have in mind at the Charity Hospital, and a post mortem examination was made, revealed what we are taught to consider the characteristic lesion of typhoid fever, as far as Peyer's patches are concerned. So we have to decide whether this condition of Peyer's patches necessarily means that typhoid fever has been at work in the system. The two things that we have to determine, then, are (1) what we want to call typhoid fever; and (2) whether we can call typhoid fever only what is put down in the books.

This is why at our preceding discussion I used the term "classical typhoid" fever. Certainly, we have very little of that here, and it is certain also that these fevers we have under discussion are not that, whatever else you choose to call them. If they ever turn out to be due to the same poison as a regular case of typhoid fever, and that poison modified in some way or other, I can not say. They certainly are not the classical form of typhoid fever. We must determine, then, whether we are to consider as typhoid fever every case that shows the characteristic affection of Peyer's patches, as revealed in post-mortem examination; or whether we can call typhoid fever only those cases which in life present what we are taught to consider the characteristic symptoms. If we are to be guided entirely by the nervous symptoms, as it is stated they do in some parts of the world, we would have to exclude the vast majority of these cases at once from consideration. That is one thing very striking, that no matter how high the temperature goes, no matter how delirious the patient may get, they do not experience the typical symptoms of typhoid fever. This is one of the differences experienced; and we also do not have coma vigilis, the murmurings and gurglings, nor the typical bloody stools that we have in typhoid fever; so if it were not for that one point, where the lesion of Peyer's patches has been detected at post mortem, I would state unhesitatingly that we could not consider such a case to be typhoid fever, because the run of the temperature is different, the character of the stools different, and the symptoms, so far as the nervous system is concerned, are different, therefore, if it were not for that one point we could exclude it altogether.

When it comes to treatment of this fever, whatever you choose to call it—long continued, remittent, or anything you please—I believe it is treated very easily, and with very little medication if attention is given to the feeding of the patient. By feeding I do not mean crowding food upon him, but eliminating the indigestible from his diet and allowing him only the

liquid or easily assimilated articles. Reduce the temperature by means of baths as well as antipyretics. Under such treatment I believe a large majority of such cases will get well.

Dr. Bruns: I have no experience whatever as a clinician on these subjects, but wish to say a few words as briefly and as rapidly as possible to emphasize the difficulties of the pathological side of the question from the standpoint of a microscopist.

In the first place, I think we may say we have typhoid fever here in a very much modified form, but whatever we have, whether we are able to detect the classical symptoms or not, we must not confuse ourselves and suppose that typhoid fever of the classical type does not arise elsewhere. It is very common in all the Northeastern Atlantic States, where the country is mountainous and hilly. A clinical diagnosis seems to me the simplest way of determi ing the character of such cases, but we have already heard the difficulties of reaching a correct conclusion. It has been stated that the examination of the blood for the germ of typhoid fever or the plasmodium of malaria is the better way—the exact way. I believe the result are just as uncertain, and they are far more difficult to arrive at. In the first place the germ is very small. I have followed various methods with all the care that I could, and have found different and very conflicting appearances in the specimens of blood examined, and have never satisfied myself that I have seen the crescents of plasmodia, so that in the hands of one who has not special skill and some experience in these things it is not an easy matter to take a specimen of blood and say this is from a typhoid or malarial patient. It is extremely difficult to get a specimen from a patient who has not already been taking quinine, and all the authorities lay down the rule that it is no use to examine the blood if a patient has been taking quinine.

Now as to tyhoid fever cases: when I was a mere student in Philadelphia, I assisted Dr. Meyers of Jefferson Medical College, in making examinations of Peyer's patches in diseases other than typhoid fever, and we found in cases other than typhoid fever the swelling and lesion of Peyer's patches, which seemed to be exactly identical with the characteristic lesion occurring in typhoid fever—as far as we could judge it was the same. I have even seen that in a case of measles in a young child. So the mere finding of Peyer's patches, swollen and showing the usual lesion, I do not think is at all an emphatic diagnostic point. There remains therefore only the cultivation of the typhoid bacillus and its recognition under the microscope—a long and very difficult process, so that from the standpoint of a practical microscopist the difficulty of arriving at a true and logical conclusion is as great as it is with the practical clinician.

To conclude, and simply to throw out a hint, it seems to me a very weak place in the plasmodium theory, or the plasmodium fact, as already held, that in countries like this, where malaria is very rife, we see certain forms of malaria which certainly do not yield to quinine, and where, in fact, those who have most experience seem to think the administration of quinine freely rather does the patient harm than good. I have had no experience of that myself, but it seemed be to the opinion, of those practitioners whom I have heard talk on malarial hæmaturia. I must say that if the plasmodium is the organism that produces malaria, I can not see why quinine should not be administered as in other cases and then ought to do good.

Dr. Matas: This is a very timely topic with us, and although I have not had the pleasure of hearing Dr. Martin's paper, I am glad he has brought the subject up, because it permits me to supplement a paper I contributed to the State Medical Society in 1885 on the subject of "The Long Continued Fevers of Louisiana that Resist Quinine."

Without having heard the doctor's paper, I believe the fever he describes is precisely the same that I brought before the society at that time. As you see, we have already started by calling it simply "long continued fevers that resist quinine." Dr. Martin has called it simply long continued fever, and I believe almost every one is undecided as to giving this fever a specific, distinctive name, which fact is explained in large measure by the uncertainty of our etiological views on the matter.

However, as I stated, I desire to supplement my paper of 1885, because I wish

to correct the impressions conveyed, at least to correct the opinions I held at that time. In that paper I first called attention to the great clinical differences that exist between this fever and the usual typhus or typhoid types, and that they certainly were not the typical forms of malarial and typhoid fever as they are recognized throughout the world. In addition to this I called attention to the fact that these fevers were characterized by their absolute intractibility to quinine. That is one of their chief and essential diagnostic and therapeutic features. Another point I brought out was that this fever was lacking in the essential characteristic, particularly of the typhoid state, meaning by that the absence of the typical thermometrical phenomena, the absence of abdominal symptoms as a rule, the absence of the so-called characteristic eruption and the absence of anæmic symptoms which characterize the typhoid state.

To continue with the points brought out in that paper : I had satisfied myself that it was the same fever described by Dr. Guiteras as occurring particularly in Tampa and Key West. He had become thoroughly familiar with the symptomatology of typhoid fever as found in Pennsylvania and other Northern States, and when he came to the tropics and was confronted with this fever he was very much nonplussed, being unable to recognize it as any type with which he was familiar—not at all the type he had considered typhoid in Philadelphia and other Northern cities. After long observations of the fever he came to the conclusion it was a simple thermal fever, as he termed it, that occurred in the tropics, and was no more than the result of exhaustion of the heat-regulating apparatus, brought on by the long protracted heat of those latitudes. He considered the essential feature of the disease simply heat disturbance ; it was a simple fever, that was all. There was no other manifestation of the disturbance—a simple febrile action, with no bowel symptoms, and nothing at all that might call the attention to the condition of the patient except the one fact of the fever. Consequently, he called it a simple, continued, thermic fever, the result of heat disturbance.

Well, I thought this we have here was precisely the same fever, and as far as clinical symptoms are concerned, it is the same as that described by Guiteras.

Now comes the differences. Since 1885 my field of observation has been greatly enlarged, and I have seen a great deal more of this fever. It may be because the number of my patients has increased —at any rate I have seen a great many more cases, which has given me the impression that this fever is increasing in the community. I believe this is also the impression of a great many of my fellow-practitioners. I certainly am called to treat a great many more cases every year, especially in the summer months. I think also that this fever is assuming a more grave character and demands our most careful attention, and that we should come to some conclusion as to its nature and etiology.

My observations have made me change entirely the views I held in 1885, and it is proper that I state the reasons therefor.

In the first place, this fever occurs in the winter as well as summer. That is something I had not observed, except in two cases, when I prepared that paper. There is no heat then, and there should be no disturbance of the heat-regulating apparatus. I have seen such cases long after the heated season was over.

In the second place, this fever does present at times, I agree with Dr. Chassaignac, the characteristics of typhoid fever—there seems to be two types, one typhoidal and the other non-typhoidal. I can cite at least a half dozen cases occuring in the last twelve months in which the typical typhoidal phenomena have presented themselves side by side with the non-typhoidal form, one patient even lying in the same house with another—that is, one with the simple form and one with the typhoidal. One case presenting the usual diarrhœal condition, and the other without diarrhœa. Both running a course of four or five weeks, but one patient taking his own medicine, reading books and newspapers, and doing everything a typhoid patient is expected not to do, while by his side would be a brother, or perhaps a sister, presenting many of the characteristic symptoms of typhoid fever, including the internal troubles, and finally dying of perforation of the bowels.

Thirdly, I have noticed that there have been groups of cases, showing that there is an infection. I have seen three and four cases in a house in certain districts.

I have in mind now three such cases where there were a series of cases. No later than last week I got through with a family in which there were four cases, beginning with a little child, who had fever five weeks, being followed by a little sister, then by a little brother, all presenting the typical manifestations of this disease. I very soon came to the conclusion that there was one cause for all this fever, and have now fully decided in my own mind that this fever is truly typhoid fever—that it is a type of typhoid fever—surely there is no doubt about that. I admit that in the majority of cases it does not present the classical features of typhoid fever, but it does in a number sufficient to prove my position I think. Some of the cases are typhoid just as classical as we read of in the old authors.

Now, if this is typhoid, our sanitarians must investigate the question of means of prevention. Guiteras declared that he did not believe there was typhoid fever in Tampa, and we all know the opinion of Dr. Faget one of the ablest of the older physicians in the city, who held that he had never seen it and did not believe it existed here, that all typhoid cases were imported cases, etc. Guiteras believed it was impossible in Tampa and Key West because the people drank only pure rain water—cistern water, the same as we do here. But our views of typhoid fever have entirely changed. The days of Murchison I think are over, and we are not to believe any more that the existence of typhoid germs depends entirely upon sewerage or drainage. If we admit the bacillary origin of typhoid fever, we must admit other ways of propagation. I think typhoid is spread by many other ways than by water. It is a subject worthy of investigation from a purely sanitary standpoint, and is becoming more and more a serious problem in the mortality record of the city.

The matter of the identification of this fever with typhoid fever, and the difficulties of recognizing its etiology from a pathological standpoint, have been brought up, and the difficulty of identifying the disease by means of the microscope has been well established by Dr. Bruns. I think it is a subject that deserves thorough sifting from a clinical standpoint alone. Although we have nothing to substantiate the character of this fever from a clinical standpoint, I believe it is typhoid fever. But we want a bacteriological diagnosis of this fever, and I think we should formally commission some of our members to take the matter in hand and give us an exhaustive report. It is a sad commentary upon New Orleans, the largest metropolis in the South, situate in the very heart of the malarial country, in the midst of this almost epidemic fever, that we are not able to give some kind of bacteriological information on the subject. We see the work that has been done by the Italians in this direction in the last decade, done in France and Algeria, and even in Texas, and yet we have nothing to say on the matter—we who really ought to be the beacon lights in such investigations. I really hope the matter will be taken up seriously, and that we will entirely efface the bad impressions created by our apparent apathy to a subject of such importance, by a good report in the near future. And I hope particularly that that report may emanate from this society.

But to return to the subject. I think we have sufficient facts to establish this fever, from a merely clinical standpoint, and that the malaria we call "the long continued fever that resists quinine" is not malaria at all. At this point I would mention that Dr. J. J. Kinyoun, of the Marine Hospital Service, made some excellent investigations a couple of years ago upon the intestinal discharges. According to his statement he found, beside the bacillus of typhoid fever, the plasmodium of malaria, both micro-organisms being found together, so he said he had been able to confirm the position taken years ago, that two poisons could exist and thrive in the human organism at the same time. While I have great respect for the ability of Dr. Kinyoun, I am not sure that he may not have been mistaken—especially when you consider the acknowledged great difficulties of the identification of the bacillus, I am inclined yet to doubt, I will not say the correctness of his observations, but at least his conclusions.

I think the treatment is the simplest part of the problem. In that I coincide with the previous speakers, excepting that there are cases which will tax all our resources, therapeutic as well as medicinal. One very important thing we have to a great extent neglected in the application of the treatment of Brown in our typhoid

cases is cold bathing. I know it is not a treatment at all in favor in the community, and that with certain people, if you mention bathing, it means a change of physicians. Water is something that is held in perfect horror in the treatment of fevers. This I think is the result of the old treatment of the French nurses in yellow fever cases. The sweating process became so much in vogue that it is hard to dislodge it. It is our province to introduce this method, which, properly applied, is so beneficial. It is one of our most valued resources, but unfortunately too often neglected. The treatment by antipyretics has been a very favorite treatment. These remedies were rather new in 1885, when I referred to them in my paper. I got them as soon as they came out, and remember specially importing antipyrin for a special case. The rapidity with which these anti-thermic coal tar products will reduce temperature is something wonderful, and they have become thoroughly essential. But cold bathing is the only agent that will control pyrexia with safety, and I believe that the rules of Brown should be carefully followed in its application. We must know how to apply it, and must have intelligent nurses as aids. Intelligent nursing is really of the utmost importance in the treatment of these long fevers. I have seen a bath keep down temperature for three or four hours. A very interesting illustration occurred not very far from here, where a bath always kept the fever down for four or five hours at a time. It was applied with great care and precision, a thermometer being used always with the water as well as the patient. Our inability to always control our nurses is one of the great troubles in the application of this method; but we should not forget its utility and the necessity for forcing it upon the community in spite of old traditions to the contrary.

I have little else I might say, except that we all have a great deal to do with these long continued fevers, and that we all know better how to deal with them than how to settle their etiology.

Dr. Bloch: This paper has been so fully discussed by the gentlemen who have just spoken, I feel almost anything I can say would be superfluous. I have been very much interested, having had a number of such cases under my personal observation—some outside, but mostly in the Charity Hospital. My efforts to cure them with drugs have been peculiarly fruitless.

Dr. Forcheimer, of Cincinnati, in his very excellent article in Keating's Encyclopedia of Diseases of Children, related how the excavation of a certain street to lay a sewer pipe caused an epidemic of fever all along that street. They called it typho-malaria. It was not malarial fever, for quinine had no effect upon it whatever; it did not yield. It was not typhoid, because there was no source of infection. However, if what Dr. Matas has said is correct, and I believe it is, it was typhoid fever of a modified type, as our experience shows that typhoid can enter the system through some other medium than the water; this must have been something of that sort. Among the many cases I have had of this so-called hybrid fever, I do not believe there has been one of real typhoid fever—not one with sordes on the teeth, with delirium, diarrhœa; not one which quinine has controlled; the only benefit derived was from small doses of quinine and antifebrine, given every two or three hours, which kept down the fever to some extent.

At the last meeting of our society I spoke of three cases in which typhoid lesions were found, the patient presenting no symptoms of typhoid fever. To-night I present the chart of a man who came to the hospital after being sick ten days, presenting at the time the typical symptoms of typhoid fever. The man died. My student held the post mortem for me, reporting no lesion of the intestines.

I have received great benefit from the cold bath, which I have always found acceptable to the patient if properly given; not only has the temperature been reduced, but it has always produced a quieting effect, promoting rest and sleep. I attach great importance to the diet, and will not allow anything of a solid nature to go into the alimentary canal.

Dr. Parham: It would be difficult for me now to say anything that has not already been said. I was very much impressed with the importance of some of the cases, or groups of cases, which Dr. Matas reported. It seems to me that if we could collect data regarding a sufficient number of such groups it would settle the question for us—as to the nature of this fever. Certainly such a thing as typhoid

fever exists. Anybody who has been East and seen twelve to fifteen people in one ward of one hospital sick, with the same symptoms, must be convinced there is such a thing as typhoid fever. I must say that I have not seen here what I consider a typical case of typhoid except, possibly, in the Charity Hospital. In my private practice I have not met a typical case of typhoid, though I am firmly convinced that most of these cases denominated continued malarial fever were really typhoid fever of a modified form.

It seems to me that if this society could have data taken of all cases of these long continued fevers that resist quinine for say a year, and at the end of that time have a committee take charge of those reports and draw some conclusions, I believe the results would be of great value. The case of which Dr. Matas speaks, where there was a case of typical typhoid fever, and others alongside of what he terms simple fever—or what Dr. Guiteras called simple thermic fever—where the fever was the only symptom, that is a very remarkable observation, and one which I have never been able to make myself. It seems to me that if Dr. Matas would collect these facts and report them to this society, and then all of us follow suit, reporting all our cases of continued fever, say for a year, that the results would at least be very interesting; and then get all possible data from the records of the Charity Hospital regarding autopsies on such cases. I believe we would in this way get some very valuable data. I think a committee should be appointed to undertake this work, and that every member of this society, especially those who attend the most regularly, should oblige himself to report every case of continued fever which resists the action of quinine.

Dr. Scheppegrell: As Dr. Matas is convinced that this fever is identical with typhoid fever, it may not be uninteresting for me to mention some facts regarding a small epidemic with which I was connected some years ago, when I was practicing in Charleston, South Carolina. I was physician for a phosphate company, which operated about five miles from Charleston, and had a settlement of its own, employing between 300 and 500 workmen. I was called one day to see a case of fever, which in a few days developed all the seeming symptoms of typhoid fever—nose bleeding, diarrhœa, tympanities, etc. About a week later I had two more cases, and then concluded that as all these workmen procured their water from one well (there was an artesian well on one side of the works and a common well about the middle of the settlement, from which most of the workmen drew their water), I concluded that this well was the source of infection, as it received surface water. I had it closed, the pump removed; but about a week later I had five more cases, and a careful investigation showed that, although the pump had been removed, some of the families of the workmen had been taking water from the well, intended for washing purposes only, but the men would come in hot and would drink from the bucket containing this well water. I reported the matter to the president of the company, who had the well filled up and another well dug on the upper part of the hill, and we had no more cases of fever. There were eleven cases in all. Three cases died of intestinal hemorrhage, and the autopsy showed lesion of Peyer's patches as well as hemorrhage.

Dr. Theard: I would have preferred very much to remain silent. The younger members of the profession in these gatherings can spend their time much more profitably by being all ears than by being all tongue—by listening to the words of members of maturer years and wider experience; but since all must contribute their mite, I will have to do as the others do. While the case of which I speak is not directly in line with the discussion, it is one that nonplussed me at the time, and one I think is remarkable so far as heat record is concerned. I diagnosed it and sent in a death certificate to the Board of Health with a high-sounding name attached, but even now I am not entirely satisfied that I knew what was the matter. It might have been something else, but if so I could not detect it.

I was called at night to see a young Italian, aged 24 years, who had been married only thirty-six hours. He had fever at 1 o'clock and went to Dr. Fourguette at 2 o'clock, who prescribed a remedy for fever. At midnight the patient had high fever and again sent for Dr. Fourguette, but he was not in the office and I was called. I placed the thermometer in the axilla, and on looking at it thought

surely the column had dropped—it registered 111 deg. I knocked it down and again it went up to 111.° Again I knocked it down, and again it went up to 111.° Again I knocked the column down, washed it, and tried it in my own mouth, where it showed normal. Placed again in the axilla it registered 111.° This was conclusive. As there was vomiting and the pupils seemed larger than normal, I suspected foul play, as the man was an Italian and married only thirty-six hours, but I could not detect any sign of poison. I gave injections of quinine and antipyrin, which brought the fever down to 103 deg. In the course of four hours the patient was dead. As I said I sent in a certificate with a high-sounding term attached, but even now I am perfectly nonplussed. I can think of no condition that might have occasioned such a fever. The thermometer was proven correct, for I tried it next day with another. I tried it with two physician's thermometers. The heat was such that the rise was sensible to the touch. I should much like to know if any others have experienced cases showing such abnormal febrile symptoms, and to what they attributed them.

Dr. Bruns: I would ask Dr. Matas if he has ever seen a malarial temperature of 111 deg. I believe that temperatures of that range can only be of nervous origin.

Dr. Theard: That was the diagnosis sent in. I had to give some diagnosis, but I have been nonplussed and worried over the case ever since. Whatever the cause of the fever I believe the patient would have died. I should like to hear what other disease might have brought on such a condition. I supposed such a high fever might have been experienced in erysipelas—I have heard of it in no other disease.

Dr. Matas: The highest temperatures have always been associated with some heat stroke—especially if the subject has been in the habit of taking intoxicants.

Dr. Chassaignac: I remember distinctly a case where a man recovered after remaining comatose for forty-eight hours, and where the temperature registered was 110¾ degrees. It was a year when we had more cases than in any year I remember. It was during my student days. We had a large number of cases, many of them with exceedingly high temperatures. I think this was the highest I saw registered.

Dr. Parham: I remember cases in the Charity Hospital, during the yellow fever epidemic of 1878, where the temperature went up to 108, 110 and 113.° A remarkable thing was that the temperature continued to go up after death.

Dr. Martin: Possibly you will recall a similar case, where a party broke his neck at West End. We brought him in, and about six hours afterward the temperature in the axilla was 108 degrees. The autopsy proved the diagnosis.

Dr. Theard: In my case there were none of these symptoms present, especially as the case was at night, and my recollection is that the night was cool.

Dr. Kohnke: I can remember clinical cases where I was rather inclined to consider typhoid fever, but feared to entertain the opinion against what I thought to be the prevalent judgment upon the question. After a thorough investigation, I believe we will call many cases typhoid boldly that we would have feared to call typhoid before. They have not changed any, but as in cases of grip at the beginning of the grip season, we hesitate to call it grip, but when we see our contemporaries gradually coming down to grip we fall in, and then call grip what we perhaps thought was grip before, but feared to be too soon.

Dr. Martin then referred to the groups of cases spoken of by Dr. Matas, some presenting the typhoidal type of fever and some only the so-called simple thermic fever, and in some cases both forms occurring side by side, and mentioned a case that had come under his own observation, where a man had been sick with the simple form, and had for a part of the time conducted his business as usual, while in the same bed lay his wife who had an unmistakable case of typhoid fever, all the symptoms being present except the eruption.

Speaking of the giving of baths, the doctor said he did not think any objection would be made to bathing if administered in the way it is given at the Sanitarium. It is really a wet pack. The patient is but on a bed that can be handled easily, and the head is lifted two or three inches. Put the patient on a rubber sheet, and have the water poured on the top at any temperature required. It is generally sprinkled on. The patient does not necessarily have to be taken out of bed. This will bring down the temperature to a marked degree.

# THE MEDICAL AND SURGICAL REPORTER

ISSUED EVERY SATURDAY

ADDRESS

Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D., Editor.

RODERIC C. PENFIELD, Publisher.

PHILADELPHIA.

**TERMS**:—Five Dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

**REMITTANCES** should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

**NOTICE TO CONTRIBUTORS**:—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, DECEMBER 2, 1893.

## EDITORIAL.

### ST. ANTHONY—UP TO DATE.

Ancient chronicles inform us that the venerable and original

"St. Anthony sat on a lowly stool,
And a book was in his hand;
Never his eyes from its page he took,
Either to right or left to look:
But with steadfast soul, as was his rule,
The holy page he scanned.

"We will woo," said the imp, "St. Anthony's eyes
Off from his holy book;
We will go to him all in strange disguise,
And tease him with laughter, whoops and cries,
That he upon us may look.

"The Devil was in the best humor that day
That ever his highness was in:
And that's why he sent out his imps to play;
And furnished them torches to light their way,
Nor stinted them incense to burn as they may—
Sulphur, and pitch, and rosin.

"So they came to the Saint in a motley crew—
A heterogeneous rout:
There were imps of every shape and hue,
And some looked black, and some looked blue,
And they passed and varied before the view,
And twisted themselves about:
And had they exhibited thus to you,
I think you'd have felt in a bit of a stew—
Or so should myself no doubt.

* * * * * * *

"But the good St. Anthony kept his eyes
Fixed on the holy book;
From it they did not sink nor rise;
Nor sighs nor laughter, shouts nor cries,
Could win away his look.

* * * * * * *

"Last came an imp—how unlike the rest!—
A beautiful female form;"

Well! this last effort proved successful, but his Satanic majesty evidently made a miscalculation, for he woke up the good saint so thoroughly that he grasped the situation, experimented with the apples of Sodom, and, eventually clearing his mouth of ashes, waged unceasing war against the entire impish crew. So well have his successors carried on his campaign that the Practical Joker with horns, is compelled to use every means of offense and defense furnished by the greatest engine of civilization—the printing press, and the present incumbent of the saintship, surnamed Comstock, is constantly and from all sides assailed as an 'imbecile,' 'crank,' 'libertine,' 'fool,' 'monster,' etc., etc.; is used to point the moral of that hoary aphorism "to the pure all things are pure;" is proved the 'lascivious incarnation of obscenity;' is pitied 'as one whose object in life is to rake up smut,'

and has 'his own morality judged by the amount of supposed immorality that a prurient fancy can succeed in ferreting out.' We tender this canonized unfortunate the assurance of our most distinguished consideration.

The experience and judgment of the Anthony Saints is thus summed up:

"There are many devils who walk this world,
Devils large, and devils small;
Devils so meagre, and devils so stout;
Devils with horns, and devils without;
Sly devils that go with their tails upcurled;
Bold devils that carry them quite unfurled;
Meek devils, and devils that brawl;
Serious devils, and laughing devils;
Imps for churches, and imps for revels;
Devils uncouth, and devils polite;
Devils black, and devils white;
Devils foolish, and devils wise;
But a *Woman, photoed without disguise*
Is the worst devil of all."
(*Altered for the benefit of the present saint.*)

The St. Anthony principles are indorsed by all civilized governments, and are embodied in the laws operating for the suppression of vice and crime. The propriety of such laws, appealing to the common-sense of individual citizens, is unquestioned so long as the interests of the individual are not in conflict with the law. The Federal law of the United States decrees, in effect, that no obscene literature or cuts displaying those parts of the body which it is immodest to expose to view, shall be admitted into the mails, the law presuming that such literature and pictures are sent out for immoral purposes or from mercenary motives which utterly ignore all considerations of public morality. The decision as to what is or is not fit to be admitted into the mails is left to the Postmaster-General and by him to the Inspector of mails.

Inspector of Mails is the official title of the present occupant of St. Anthony's stool. This gentleman has at divers times, in divers places and by divers means made himself to be disliked by certain of the scribes and pharisees—hypocrites, because he has so far departed from the rule of the founder of the stool that he can by no means be induced or compelled to rivet his eyes on the holy page, but persists in scanning unholy pages in search of tracks of the imps who occasioned his predecessor so much trouble.

The REPORTER has not been in sympathy with all the official acts of this gentleman, but it recognizes his great moral courage, his conscientious performance of his duty in the face of stupendous obstructions, that the mistakes he has made have generally been on the safe side, and it measures his efficiency by the amount of obloquy and abuse he has sustained.

In the present instance the REPORTER is in entire sympathy with the U. S. Inspector of Mails. The situation, as given in a circular letter by the company involved, may be summed up as follows: The company manufacturing appliances for the use of physicians issued a catalogue, parts of which were copyrighted, advertising their appliances and giving a number of cuts in illustration of the uses of their articles. Among these cuts were some from photographs of nude models, taken in different postures and undoubtedly within the limits prohibited by law. These catalogues were widely circulated through the mails—professedly sent only to physicians. The manager of the company has been arrested by the Inspector, charged with the violation of the postal laws, on the ground that these laws cover "any print exposing part or all the genital organs of either male or female," and that all prints, books, pamphlets or what not, containing such illustrations, are in violation of the postal laws, no matter for what purpose intended or used.

From this action of the Inspector of Mails, the company, alert to the advertising value of the situation, generalizes to such an extent as to make the Inspector's decision cover all medical literature what-

soever, containing illustrations that would come under the law quoted, and making it appear that the intention was to enforce the law without discrimination. Thus obscuring the point at issue by urging an impending catastrophy to medical literature. This circular was sent to the medical journals in hope of creating sympathy —and possibly of securing a unique advertisement that money could not buy.

The REPORTER believes the action of the Inspector of Mails right. The grounds for action were undeniable. The illustrations are not only objectionable but utterly useless so far as giving physicians any needed information, while it would be an insult to ordinary intelligence to allow a patent advertising sheet to be classed as literature of any kind, much less to claim protection as medical literature or as being of any value to medical men. Furthermore, there is no assurance that this advertising medium goes to physicians only. There is no reason why the law should not here be applied as it would be if the same illustrations were used in the advertisement of any other business.

The assumption that this advertising sheet could be classified as medical literature would be too absurd to notice were it not for the fact that these and kindred illustrations have appeared in sundry journals of more or less medical repute. Such use would indicate a possible value, but a mere glance will show that the change of location has neither diminished the undesirability nor enhanced the utility of the pictures. It will be observed that gynecology is invariably made the excuse for such a display, probably because the protection by copyright was extended only to the weaker sex, and copyrighted plates alone could answer all requirements.

An analysis of one of these alleged medical articles will disclose—(*a*), a double leaded heading exalting some system of posture in the treatment or cure of the indispositions of ladies: (*b*), the initials M. D., appended to some name the profession recognizes as worthy of the article produced: (*c*), an 'apology for calling the attention of the profession to a method of treatment usually overlooked, but of such vital importance, etc., etc.'; a few frayed-out platitudes, with incidental acknowledgement of indebtedness to the dealer, through whose kindness the author is able to present the following very interesting pictures; more platitudes. All together serving to introduce 'these pictures from life which will fully explain themselves without further comment:' (*d*), a series of photographs from nature, of 'the human (female) form divine,' clad in an halo of light more or less concentrated, and folded into postures in which the element of divinity is not obtrusive. Such articles deprived of their illustrations are meaningless. When fully bedecked with the unadorned beauties of nature they amount to the same thing.

There must be some value somewhere, but the exercise of common-sense will speedily discover that no value accrues to the profession at large. For this species of illustration the most radical will not claim artistic merit. To suggest that they are of use in aiding a medical man to the understanding of any subject they have served to illustrate, more than diagrams or conventional figures would, in the same connection, is an affront to the intelligence of the profession. The positions as portrayed are never seen in practice, and it would be both an insult and libel on the profession to intimate that any attempt is ever made by physicians to subject their patients to such exposure.

Useless to the profession, repulsive to the respectable, under the ban of law, such pictures would never be missed from medical literature, and when for any reason they are allowed to masquerade as

charts for the guidance of medical practitioners we are of the opinion that science would be much benefitted by visit from St. Anthony to the journals circulating such frauds.

At present the REPORTER is not terrified by a prospect of censorial supervision of medical literature.

# TRANSLATIONS.

IN CHARGE OF M. B. WERNER, M. D., AND W. A. N. DORLAND, M. D.

## TUBERCULOUS TYPHLITIS AND APPENDICITIS.

In *Le Bulletin Médical*, June 25, '93, Reclus observes that the clinical reports of tuberculosis of the cecum have accumulated rapidly during recent years. The cases of Bouilly, Terrier, Hartmann, Reynier, Broca, Roux, Salzer, Billroth and Hochenegg, the anatomical researches of Duguet, Spillmann, Hérard, Cornil and Hanot, and the recent descriptions of Pilliet and of Le Bayon have thrown some light upon this hitherto but little recognized affection. The cases have been numerous enough for one to attempt to tabulate a statement of the clinical manifestations of tuberculous typhlitis and appendicitis. Reclus himself has observed two cases where a long-continued clinical history has been sustained by post-mortem examinations. This affection may manifest itself as a localized tuberculosis without infiltration, without concomitant degeneration of the lungs and other important viscera, developing itself around the ileo-cecal valve and its vicinity without invading the other tissues. This suffices to class this tuberculosis among the surgical tuberculoses; from the moment it is confined to a limited focus and this focus is accessible, in such favorable circumstances intervention is legitimate. Therefore in certain cases—and the observations are becoming daily more numerous—perityphlitic tuberculosis is an ordinary surgical affection.

As to the etiology of this condition the literature is scant; the degeneration here, as in most of the other tuberculoses, seems most frequent in adult age, but the young do not escape; a little boy 10 years of age has been cited as dying from this affection; the greatest number of the cases published, however, have been in individuals who neighbored upon or who had passed thirty years of age. It seems that two distinct anatomopathologic forms may be described, associated with different symptoms: the one a fibrous or hypertrophic and the other an ulcerous variety; moreover these may be combined, or there may be noticed all the intermediate stages between them. The majority of the cases thus far reported have been characterized by an abundant new formation which gave to the degeneration, the appearance of cancer. In this form, the tumor after incision of the abdominal parietes appears fused with the double parietal peritoneum with new membranous formations which cover the intestines and mark their limit; the original form of the cecum and its appendix, the ascending colon, the ileo-cecal valve, and the termination of the ileum cannot be recognized. There is a muscular and a mucous hypertrophy at this point which causes the intestinal wall to measure at times up to three or four centimetres. The lesions ordinarily are most marked around the ileo-cecal valve; the valve is profoundly altered from the beginning; in its place is found an irregular cavity, covered by a partly ulcerated mucosa; the loss of substance is irregular its edges sinuous, the base sanguineous with small rigid villosities. The appendix is bent upon itself and adherent at times in front of the cecum at times behind it; it is lost in the thickness of the false membrane.

The second or ulcerated form may present thickening of the serous and false membranes around the intestinal loops, but these have not the remarkable hypertrophy of the other form; on the contrary the ulcerative process predominates, the mucosa has often completely disappeared, especially at the site of the ileo-cecal

valve where ordinarily a veritable cloaca is found due to the destruction and anastomosis of the various intestinal segments. The softening of the cheesy masses in the tunics and the neighboring ganglia have given rise to puriform collections, which run in various directions, but generally make their way towards the abdominal wall; through the resulting fistulae fecal matter and pus escape. These pyo-stercorous canals are often multiple.

There exists a third form which Professor Cornil has especially studied. Often in place of the fecal concretion which forms in the appendix, some foreign body, bone, a fruit seed lodges there and by its presence irritates or perforates the vermiform process and a tuberculous forms, the bacillary colony destroying the walls.

The symptoms of the first form in the beginning is the existence of deep pains in the region, lasting for some hours during the day, then disappearing and appearing anew. This attack subsides only to reappear in a few weeks in a more aggravated form. Constipation accompanies it and may be extreme. On examination the presence of a tumor is demonstrated in the right iliac fossa hard, resisting, bosselated, irregular. In these cases where softening has taken place fluctuation may be pronounced, or the skin becomes red and the abcess opens with the formation of a fistula. The diagnosis becomes plainer still when in place of the extreme constipation a rebellious diarrhœa appears resulting from the abundant and persistent ulcerations of the mucosa. The general health does not suffer in either form at first. As to the treatment of these cases, surgical intervention is the only proper and justifiable course. D.

## ETIOLOGY AND TREATMENT OF ABORTION AND PREMATURE LABOR.

Prof. Max Stumpf has collected his material for studying this subject at the Maternity, in Munich, during the period May, 1884, to November, 1889. During this time there were 446 cases of premature labor—184 cases of abortion; 115 cases of *partus immaturus*; 147 cases of *partus prematurus*. The author considers in his studies, in connection with premature labor, the age of the patient, the number of previous interrupted and mature births, as well as their causes and complications.

The treatment in 169 abortions was purely expectant and symptomatic—that is tamponing the vagina and the internal administration of ergot. Of these, 142 recovered without complications; 5 suffered from subsequent hemorrhage; 9 from infectious diseases; of these last, 5 had slight fever and 4 offensive lochia. A comparison of the cases teaches that the retention of the membranes increases the possible infection, but more particularly the dangers of subsequent hemorrhage.

In 11 cases of septic abortion, the author used 3 per cent. solution of carbolic acid as a disinfecting uterine injection. This also acted as a means of inducing uterine contractions, thus aiding in the expulsion of any remaining shreds.

The author believes that the conservative treatment in abortions will be followed by better results, and should not be displaced by active measures more recently advocated.

In *partus immaturus*, Dr. Stumpf is also inclined to wait spontaneous separation and expulsion of the contents of the uterus, adopting active measures only when persistent hemorrhage or symptoms of sepsis set in. The results in *partus immaturus* are less favorable than in abortions. Of 115 women, 5 died of sepsis; 2 of uræmia; 1 from tuberculosis; 1 from hemorrhage. The mortality due to infection treated on the expectant plan was 14.5 per cent., while the operative procedures raised the mortality to 40 per cent.—*Müch. Med. Woch.*, xxxiv, 1892.

### A Serious Condition.

Old Lady—Doctor, do you think there is anything the matter with my lungs?

Physician (after a careful examination)—I find, madam, that they are in a normal condition.

Old Lady (with a sigh of resignation)—And how long can I expect to live in that condition?—*Pharmaceutical Era.*

## ASCITES—ITS TREATMENT FROM A GYNECOLOGICAL STANDPOINT.

Dr. Gusserou reports cases of ascites, in which disease of the circulatory apparatus such as the liver or kidneys can be excluded, the natural supposition follows that it originates from some disease of the genital organs or peritoneum. In order to make a positive diagnosis an exploratory incision should be made in the median line of the abdomen 6 cm. in length. Puncture is of no avail and often proves dangerous. It is necessary to see as well as feel in order to decide the seat of disease and whether further operative measures would be justifiable.

The various cases coming under this category can be classed as follows:

1. Ascites due to so-called tubercular peritonitis. In a case of peritonitis nodosa, Gusserou was able to effect a cure by incision, washing and draining.

2. Ascites due to papilloma of the ovaries. The cause was discovered in 4 cases only after the exploratory incision. The removal of the diseased ovaries effected the only means of relief.

3. Ascites from carcinoma of the ovaries or peritoneum, In 3 cases all diseased tissue was removed; in 5 others some malignant nodules could not be reached; and in 5 more it was impossible to remove anything. In all cases, however, the incision gave relief; in some improvement; in a few complete cure.

4. Cases of ascites produced by benign disease of the genital organs. In 1 case it was caused by fibroma of the ovary; in 2 by tubal disease; in 9 by ovarian cystoma.—*Schmidt's Jahrb.* No. 9, 1893.

W.

## THE BACTERIOLOGICAL CRAZE.

This is the age of germ rabies, and stark madness has overtaken the hygienists and the public with reference to bacteric infection. Every ounce of water we drink and every cubic foot of air we breathe is supposed to be scientifically assayed, and if more bacteria than the approved minimum are found, we are threatened with terrible consequences. The joke of the matter is that the people who are the victims of the craze do not seem to be able to see farther than their noses. They are in agonies of apprehension lest their milkman may have diluted his liquor with bacteria laden water, and they excessively excite themselves if the cubic contents of their sleeping-rooms is below the scientific minimum ; but they pay no regard to the fact that, from morning to night, they are imbibing monstrous doses of bacteria through other media. They never think of the danger of carrying about their person a bank-note which has been bosomed for unlimited time by a reeking fishwoman or costermonger—they box themselves up in a theatre or concert-room packed with inconceivable myriads of germs of all sorts of diseases—they suck grapes which have passed through an endless series of dirty hands, and they smoke cigars which have been lately grasped between the lips and fastened with the spittle of, perhaps, a phthisical tobacco-worker. Lastly, they will cool their glass of champagne at the most *distingue* dinner-party with the ice recently frozen off a ditch which is little better than a cloaca, and they trouble not themselves about its bacteric befoulments. We notice we are moved to these observations by the fact that this latter point has been taken up by the Parisian hygeists, and that laws are being made to control the sale of dirty ice. It has been clearly established that much of the ice used in the most aristocratic cafes and clubs is taken off ponds impregnated with every describable abomination, and that when this ice is melted, myriads of bacteria of every form of virulence are found in a state of activity. We are not to be understood to discourage precaution against the use of foul water or foul air. It is well to be clean, even though we cannot be of spotless purity, but there is no doubt that the bacteric hobby is, at present, being ridden to death, and that any of us who survive for another twenty years will then laugh heartily at the fashionable craze of to-day, just as we now laugh at the iridectomy mania, Koch's tuberculine, or any of the equally *de rigueur* crazes of the past twenty-years.—*Medical Press.*

# ABSTRACTS.

## CHANCRE OF THE MOUTH.

In the *Medical Record* there is a paper by Dr. Harrison Griffin, with statistics and a report of twelve cases, three occuring in children in one family. In 1200 cases of syphilis the primary chancre was situated in the region of the mouth in twelve cases.

Case 1. Male, aged 9, had chancre of lower lip slightly to the right. He had painful enlargement of cervical and submaxillary glands on the right side; also on left side, but not so marked. Induration not to the same extent as is usually found when the sore is on the penis. A papular eruption appeared on the body soon after. The lad had received the infection by fetching beer for laborers in a pail, and occasionally drinking after a workman who was syphilitic. The boy's father was warned to supply him with a separate towel, glass, cup, etc., and to let him sleep alone; above all, not to let him kiss anyone. He was also removed from school.

Case 2. A brother of the previous patient, aged 12, was some time after found to have a chancre on the right tonsil. The inoculation took place through a stick of candy that the elder brother had put in his mouth after the younger brother had sucked it. The history of the eruption is entirely at variance with the time that usually elapses between the presence of the chancre and the ingress of the eruption in the adult life. In the first case the eruption came out ten to twelve days after the presence of the chancre, in the second case thirteen days after the initial lesion.

Case 3. Sister of above cases, contracted a chancre of the upper lip by kissing her brother. The eruption appeared about twenty-six days after the initial lesion.

Case 4. Male, aged 8, had sore on right tonsil, with enlarged neighboring glands. He had contracted it from impure practices. The history of this case was very decisive.

Case 5. Female, actress, aged 24, with chancre on lip. She made-up for the stage in the same room with another actress, who was found afterwards to be syphilitic. The medium of contagion was supposed to be the rouge-pot.

Case 6. Female, aged 18, contracted a chancre of the lip by kissing. There was eruption of the skin and enlargement of the glands.

Case 7. Female, aged 23, with chancre of lip. Infected by her syphilitic husband.

Case 8. Male, aged 42, chancre on upper lip. Drinking whisky from bottle after some friends, one of whom was syphilitic, was the mode of contagion.

Case 9. Male, aged 28; mucous patches at tip and side of tongue, and also covering inside of lower lip. He had been married six weeks, although he knew he was suffering from syphilis. He was forbidden to kiss his wife. Three weeks later his wife was found to be infected with a chancre on the upper portion of the tongue. She suffered from an extensive tubercular eruption; large ulcerated spots covered her back and breast; it was a case of malignant syphilis.

Case 10. Female, married, aged 28, chancre of upper lip. Contracted through kissing her syphilitic husband.

Case 11. Male, married, aged 30; contracted chancre from prostitute. Inoculated his wife with chancre of the lip.

Case 12. Female, cook, aged 20; caught sore on lip by kissing her lover, who was suffering from mucous patches of the lips and tongue. On account of its early diagnosis, the disease was not transmitted to the young children of the family.

Considering how readily the mucous patch of the mouth will inoculate a chancre, it seems strange that there are not more cases reported of the primary lesion occuring in this locality.

Physician (with ear to patient's chest): "There is a curious swelling over the region of the heart, sir, which must be reduced at once."

Patient (anxiously): "That swelling is my pocket-book, doctor. Please don't reduce it too much."—*Our Dumb Animals.*

## CONCERNING TYPHOID FEVER.

Dr. Victor C. Vaughan (*Medical News*) says:

There may be such a thing as typho-malarial fever, but no man has ever, as yet, demonstrated its existence. To-day there are three theories concerning the causation of typhoid fever:

1. The German theory, that typhoid is caused by a certain germ; that it is a specific disease, the same as smallpox. One of the definite characteristics of the germ is that it will grow upon a potato, forming an invisible growth. The Koch-Eberth germ is the only germ capable of causing typhoid fever.

2. Another theory we may designate as the French theory, which is that the cause is a modified form of the bacillus *coli communis*, which sometimes acquires extraordinary virulence. If the French theory is correct, the pollution of water with any fæcal matter may cause typhoid fever. If the German theory is correct, it would be perfectly safe to drink all the fæcal matter you wish, provided it comes from healthy persons.

3. There is another theory, and that is that typhoid fever may be caused by any one of a number of germs, which are closely related to one another, but which are not connected either morphologically or physiologically, and consequently we cannot expect the symptoms to be the same in the cases.

For the last twelve or fifteen years I have, on account of certain official positions, investigated every outbreak of typhoid in the State of Michigan, and for the last six or seven years I have accompanied these with a bacteriological examination, both of the drinking-water supply and, for the last two or three years, of the spleens of the persons dead from typhoid fever. While I have seen thousands of cases of typhoid fever, I have yet to see a case of *typical* typhoid fever, as described in the text books, where the temperature is graded day after day. Of course, in many of these cases the temperature is interrupted by the treatment. Further I have never, as yet, found in the drinking-water, or in the spleen of a person dead from typhoid fever, a germ identical with the supposed specific germ. Occasionally I have found germs which form an invisible growth on potato, but they have been different from the Eberth germ. In a recent outbreak at Ironbrook I inoculated beef-tea, and after twenty-four hours injected it into animals. The germs was then found in the spleen, kidney, and liver. I directed sent to me the spleens of all persons dead from typhoid fever, and in these, which were quite a number, I found the same germs as in water. I think this pretty positive proof that the germ caused the disease. I think we have a group of causes, just as in the vegetable world we have a number of plants which produce poison, varying in virulence according to the conditions in which the plant grows. Tobacco grown upon different kinds of soil will show changes. Why not germs, which pass through a number of generations in a short time? A woman living in the country does not go from home but dies from typhoid fever. A post-mortem is held, and it is found to be true typhoid fever. Some contend that such cases are caused by infection carried by a tramp with walking typhoid fever, who, visiting the various watering places, infects the neighborhood. There are annually 50,000 deaths in this country of typhoid fever, and 500,000 sick with it. This shows that the germs must be widely distributed. I am sure that healthy individuals aid in distributing the disease.

### The Testicle in Hereditary Syphilis.

1. The testicles may be affected so slightly in congenital syphilis that it needs the microscope to detect the malady. 2. In a small percentage of cases of congenital syphilis, the lesions of the testicle are such that they can be detected by physical examination. It appears, as a rule, in the first two or three years of life. 3. The globe is chiefly affected; and there is no affection of the prostate, vas, or vesiculæ. 4. The disease is frequently bilateral. 5. Hydrocele is fairly frequent, the swelling is painless, and may be nodular. 6. The enlargement great. The microscopical appearances are those of inflammation of the fibrous tissue framework of the organ, leading to fibrosis, and, if the disease is not checked, to atrophy of the organ. Gummata are rare.—CARPENTER.

## A COMMITTEE ON DRINK.

In all the more highly civilized countries that venerable puzzle, the drink problem, is forcing itself upon the attention of the authorities in government and science. Science, hitherto, has meddled with it comparatively little. The chief fighters against drink in our line have been the temperance enthusiasts, whose appreciation of the evils of it have been sufficiently vivid, and whose zeal has been intense, but not always according to knowledge. Legislation on the subject has aimed chiefly to keep drink away from men, but its results, where it has had a fair trial, as in Iowa or Maine, have not been altogether satisfactory. In England just now measures are under consideration which aim not to keep drink from drunkards, but to keep drunkards from drink. The submission of plans with such an object marks in itself a considerable progress of opinion in a country where the right to be peaceably drunk has always been considered one of the natural privileges of citizenship. A committee of eminent physicians and persons skilled in dealing with animals, appointed by the Salisbury government, has submitted to Parliament a report recommending that power be given to magistrates to commit drunkards to reformatories for a period not exceeding two years. The committee found that many drunkards were cured in reformatories, and that many more of them would be cured if they could be kept sufficiently long under restraint and treatment. It proposes that drunkards who voluntarily enter such retreats should be kept until discharged; that the semi-criminal habitual drunkards, with whom the police have to deal, should receive intermediate sentences of not less than one year, and that magistrates should be empowered to commit ordinary inebriates on the petition of relatives, or in their own descetion. It also proposes to empower the police to arrest without a warrant all persons found drunk in public, and to lock them up for trial. The report, as will be seen, practically denies the right of the contemporary Briton to be a drunkard, or even to be publicly tipsy. If it is adopted, and its recommendations enforced, it would seem likely to make intoxication much less satisfactory, and possibly less popular, in Great Britain than it is at present.

In France, too, the same subject is under serious discussion by experts. M. Zola, after his recent visit to London, expressed himself as profoundly shocked by the consumption of intoxicants by English ladies. French ladies probably drink less, but that French men at least are injudicious in their potations appears very clearly from the published conclusions of M. Charles Fere, the well-known Parisian authority on nervous diseases, who notices an immense increase in France of the maladies which are his special charge, and thinks it due "to the increase in beer-drinking, absinthe-drinking, and bars." Dr. Fere says that twenty-three years ago there was hardly such a thing as a bar in all Paris, but now "one sees them all over the town, and always crowded." He attributes their spread largely to the growth of the passion, now said to be well-nigh universal in Paris, of betting on race-horses. Bars and low eating-houses, where alcoholic drink is sold with or without food, are the centres of resort, he finds, for those small tradesmen, cabmen, cooks, artisans, and so on, who want to get tips and enter into sporting transactions. To the account of this sort of drinking Dr. Fere lays the increased development of nervous and mental diseases in infants—an increase which he thinks so serious in amount and so menacing in its portents that he declares that alcoholic drinks are now the great enemy of the races which do not abstain from them, and that if the Aryans go on tippling as they do, they must finally give way to Jews, Arabs, and Chinese.

This is a serious view to take of contemporary drink, and it carries the more weight because it expresses the opinion not of a lay enthusiaist, but of a scientific specialist.

The popular impression is that temperance in drink is advancing in this country, but it is reassuring to know that the whole subject has attracted the attention of a body of men who would seem to be exceptionally well fitted to deal with it in all its respects. The "Sociological Group" has interested itself in the drink problem. The Group began five years ago with fifteen members, including Bishop Potter, T. T. Munger, Seth Low, Richard T. Ely,

Charles A. Briggs, Washington Gladden, Edward J. Phelps, and Charles Dudley Warner. Its purpose is the study of modern social questions. At a meeting last spring it voted to form a committee of fifty to investigate the liquor problem, and to that end appointed a committee from its own body to nominate the fifty members. This has been done, and October 20th was the day set for the larger committee to meet, at the United Charities Buildings in New York, for organization and reports.

Here is a committee from the labors of which it would seem that results of real importance might be looked for. The Group proposed that its committee should consider its problem in its physiological, its ethical, and its legislative aspects. The committee includes eminent experts, equal to the consideration of all these aspects, and others besides. Besides the members of the Group it includes such divines as Cardinal Gibbons, Archbishop Ireland, Rabbi Gottheil, Bishop Gailor, Bishop E. G. Andrews, Dr. W. R. Huntington, Dr. W. S. Rainsford, and others not less distinguished. Among its scientists are Dr. J. S. Billings, Professors Bowditch of Harvard, and Furnam and Chittenden of Yale, and Dr. Weir Mitchell. Among its educators are President Eliot, President D. C. Gilman, and General F. A. Walker. Among men of affairs and employers of labor it has Frank Thompson, Marshall Field, and Cornelius Vanderbilt. Altogether it is a remarkable committee, fit in weight and intelligence to cope with a titanic problem. At the meeting last month the sub-committee on the ethical aspects of drink was to have made a report. The report of the committee on physiologi, cal aspects had already come in before that meeting, and maps out an exhaustive inquiry, including investigation of the effects of normal and of abnormal constituents of alcoholic drinks, and of combinations of the two. It proposes physiological experiments, which, it seems, will cost some $30,000, but if such a committee is really in earnest they will not be daunted by considerations of expense.

The American public is very generally interested in the drink problem, and wants the surest and latest information about it. It will rejoice to know that such a body of men as the Sociological Group's Committee is sounding the depths of the subject, and will look for important results from its labors. It will wish to know the committee's opinion of the patent cures for alcoholism that so greatly abounds just now, and what conclusion it reaches as to prohibition, local option, and the Guttenburg plan. It will also consider with especial attention the views of the committee on the broad and much-mooted questions whether alcohol is a poison which may be tolerated in moderate doses, or a useful servant of man when not abused.

Is alcohol good or bad for civilized man? That, after all, is the query that lies at the centre of the liquor problem. The doctors disagree about it. What will this committee say?

## NARCOLEPSY.

Sleep is a function which though in itself is very wonderful, is yet so familiar to us that its phenomena seldom excite more than an emphemeral interest. It is only when it supervenes under unwonted circumstances that interest is stimulated, and that one is tempted to inquire further into its pathology. The capacity for sleep differs considerably as between different individuals. While some fortunate persons can wander off into dreamland at a moment's notice, in train or tram, or in the intervals of conversation, others are fain to woo the fickle goddess who shows herself coy and hard to please even under the most favorable conditions. In both cases, however, sleep, when it does come, is what we are accustomed to look upon as normal physiological repose. It is quite otherwise when it comes on with the suddenness and inopportuness of a sneeze. In some cases the resemblance with epileptic coma is so close that a well-known authority used to remark that the sleep of certain patients resembles a mild epileptic attack. Generally speaking, sleep is preceded by sequential prodromal indications, such as heaviness of the supra-orbital region, constriction on a level with the temples, a feeling of vacuum in the fore-

head, a tendency to dangling of the head, yawning, etc., and it follows fatigue or supervenes in deference to long-established custom. In a large number of pathological conditions associated with disturbances of circulation or nutrition, diseases of the head or liver, digestive troubles, hysteria, etc., the inclination to sleep shows itself in a peremptory fashion and positively strikes down its victims for all the world like a fainting or other "fit." To this affection, for it sometimes borders on a morbid condition, the term narcolepsy has been applied. Not only may the subject fall as if stricken, under the imperious and not-to-be-resisted empire of sleep, but he may remain plunged in a lethargy so profound that no stimulus will awaken him, in fact, his slumber resembles slight epileptic coma. Another remarkable feature about this unnatural slumber is that it supervenes under circumstances which do not usually conduce to a nap. The subject may be seized in the middle of a meal, or while walking, or a fit of sleep may bring what might otherwise have proved an interesting conversation to an abrupt conclusion. Sometimes the attacks of sleepiness last but a minute or two, at others they persist for hours, not to say for days. Sometimes, too, the attacks occur only once a month or so, at others they may be repeated a hundred times or more in the day. In subjects prone to this peculiar manifestation any form of muscular or mental activity may determine an attack, such for instance as a long walk, defæcation, coitus, sustained attention to one subject, or some moral emotion. This paroxysmal sleep is a form in which all the normal phenomena of natural slumber are exaggerated, while muscular resolution is unduly pronounced, and may even run on to contractures. Respiration may fall to ten, and the pulse to fifty, a minute. The pupils are usually more or less markedly dilated, another point of resemblance with epilepsy. At the same time narcolepsy is usually neither a neurosis nor a malady. It occurs in a large number of conditions in which there is some disturbance of nutrition or some circulatory derangement, either in consequence of an alteration in the composition of the blood or a fall in intra-arterial pressure due to functional exhaustion. It is to a certain extent physiological, as, for example, when it supervenes in men who have eaten or drunk too much, or who, having passed middle life, still "enjoy life." It is a common symptom in hysterical and neurasthenic subjects, but is then an indication of functional disturbance of the cerebral circulation. The etiology indeed points to a special exhaustibility of the entire nervous system. In diabetes, gravel, or simple obesity the morbid sleep may amount to a sort of mild coma. When the attacks occur in epileptic subjects they present this peculiarity, that they are usually amenable to the influences of the bromides. Narcolepsy possesses a certain medico-legal interest, because its manifestations are sometimes mistaken for the effects of alcohol, indeed, many victims of this tendency live in dread of their infirmity exposing them to the suspicion of inebriety. It is evident that the differential diagnosis of necrolepsy pure and simple from the numerous conditions associated with more or less profound unconsciousness must often present considerable difficulty; indeed, unless the practitioner is enabled to derive a clue from the personal history of the patient he may not be able forthwith to decide as to the exact nature of the attack. Inasmuch as the etiology of narcolepsy is various, so its prognostic importance is grave or benign, according to its immediate source. Of grave import in organic affections of the circulatory apparatus, in maladies affecting nutrition, in general paralysis, and in dementia, it is a perfectly curable affection in hysteria and neurasthenia. In epileysy the prognosis is that of this disease in general, and under a suitable treatment the attacks become less numerous and less intense. Apart from its own special prognostic importance, narcolepsy is generally a symptom of bad augury in organic maladies in the course of which it occurs as a symptom. In certain ataxic patients, for instance, it is sometimes the first cerebral symptom, the significance of which must be borne in mind. As a general rule the treatment of narcolepsy is that of the malady in the course of which it occurs, but there are certain special measures calculated to minimise its incidence, such as venesection, hydrotherapy, baths of compressed air, and inhalations of oxygen, and the last named has in several instances given really remarkable results.—*The Med. Press and Circular.*

# CURRENT LITERATURE REVIEWED.

IN CHARGE OF ELLISTON J. MORRIS, M. D.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

for December. An interesting paper in this month's issue is that by Dr. M. H. Richardson and Dr. G. L. Walton entitled

**A Contribution to the Study of Cerebral Surgery, based on an Operation for the Removal of a Tumor.**

The operation was unsuccessful in regard to the removal of the tumor as it could not be defined owing to its deep situation in the brain substance. The patient was at first much relieved as the result of the operation but finally died, fifty-one days after the operation. The diagnosis of the seat of the tumor by means of the localization symptoms was shown at the autopsy to have been correct. The difficulty of using the rongeur forceps after the dura mater was opened would lead the authors to enlarge the opening to the fullest extent deemed likely to be required before cutting the dura mater in all cases where the pressure of the brain seemed great. The plan of cutting out a semicircle of bone and reflecting skull and skin together, breaking the lower edge for the purpose, has not recommended itself to the writers as necessarily more practicable than the old method of trephining and enlarging. They believe that the patient is safer with the bone removed than replaced, even when replaced under the most favorable circumstances. The absence of even large pieces of bone, though apparently disadvantageous, has been proved by experience to detract in no material way either from the patient's comfort or safety, whereas replaced bone is always a possible source of future trouble.

Dr. D. D. Stewart contributes a paper on

**The Occurrence of a Form of Chronic Bright's Disease, Other than Typical Fibroid Kidney, Without Albuminuria.**

The teaching of the paper is that but little stress can be laid on the mere absence of albumin from the urine in rejecting or confirming a diagnosis of chronic Bright's disease; that in any instance in which an examination for albumin is demanded as a part of an investigation to detect or exclude kidney disease, no decided opinion dare be ventured as to the absence of the latter without further search of the urine, to determine not only the mere presence of or absence of morphological kidney elements, such as casts or epithelium, but also to discover the condition of the secretory renal function. As the latter can only be determined by an examination of a mixed twenty-four hours' specimen of urine, the total daily amount passed must be known. It should, therefore, be a rule, admitting of no deviation, in all cases of suspected Bright's disease in which albumin is undetectable in a single unmixed specimen, to obtain that of the total of one or, which is better, a consecutive series of twenty-four hours. Then too, when albumin is absent in a single unmixed specimen, it may sometimes be discovered in that of the total twenty-four hours, when the more delicate tests are intelligently employed. The author advises the use of the centrifugal machine for the precipitation of the sediment in the urine.

Dr. Maximillian Herzog contributes a paper on

**Tuberculosis of the Nasal Mucous Membrane,**

reporting ten new cases. The author presents the following conclusions:

1. Tuberculosis of the nasal mucous membrane, compared with tuberculosis of other parts of the respiratory tract, preferably with this affection of the lungs and larynx, is a rare disease; it is, however, not as rare as formerly supposed.

2. It is generally a secondary affection, but occurs primarily, as proven by unmistakable clinical evidence and by post-mortem facts.

3. Where it occurs it is frequently secondary to pulmonary and laryngeal phthisis.

4. It occurs in the form of ulceration, tumors, and a combination of both. The tumor is generally found in primary cases, while the ulceration is the prominent factor in advanced cases of phthisis.

5. It may occur at any age (except, probably, in the very earliest months of life), preferably at the ages between ten and forty years.

6. It does not show any predilection as to sex.

7. Its seat is preferably the septum cartilagineum.

8. Its course is very chronic, and relapses even after surgical interference are the rule.

9. It is, *per se*, not dangerous to life, but may eventually lead to fatal complications, such as basilar meningitis, and possibly miliary tuberculosis.

10. One of its most important direct complications by continuity, is that with tuberculosis of the naso-lachrymal duct and the conjunctiva.

11. It may also be complicated with tuberculosis of the pharynx, palate, tongue, external integument; lupus of the nose, face; tuberculosis of the cervical glands, empyema of the antrum of Highmore, etc.

12. Lupus of the face, or of the nasal mucous membrane, may in its further development lead to tuberculosis of the nasal mucous membrane.

The paper also includes a statistical table of eighty cases of tuberculosis of the nasal mucous membrane reported in medical literature.

**A Contributinn to the Study of the Treatment of Appendictis**

is the title of a paper by Dr. Miles F. Porter. The author also includes a tabulation of four hundred and forty-eight cases including seven cases of his own. The difficulties of

diagnosis and the question of operation are cited. The author concludes that the danger of recurrence and the presence of a tumor are not in themselves sufficient grounds for operation. Two facts however seem settled: 1. when an operation is to be done, the earlier it is done the better the chance for recovery. 2. The character of the attack and consequent condition of the patient, and not the number of hours or days of illness, should form the basis of decision as to the proper time for operation. The author does not believe that the appendix should be removed if the adhesions are such that the attempt to release them will add to the gravity of the operation. In regard to the incision, he says that where there is a tumor this may be taken for a guide; in the absence of tumor the best site is in the right semilunaris. He advocates the Trendelenberg posture in operating. The stump of the appendix should be carefully covered with peritoneum after ligation. If this is not done, the removal of the appendix leaves the patient in great danger of perforation.

Dr. T. D. Dunn reports a case of "Pelosis Rheumatica in a Bleeder." The case reported supports the view that the disease is a special affection of which the arthritis is a manifestation analogus to that which occurs in hæmophilia.

The remaining paper in this issue is by Dr. George J. Engleman entitled "Recent Investigations in Faradic Electricity."

---

THE TRI-STATE MEDICAL JOURNAL

for December. Dr. F. Byron Robinson contributes an interesting paper on

**Axial Rotation of Tumors and Viscera; Twisting of Pedicles.**

The ætiology of axial rotation is imperfectly known, and the author, after reviewing the opinions of various authorities, suggests that visceral rhythm is the cause, viz: breathing, expansion and contraction of the digestive tract, the rhythm of the liver and spleen, and the filling and emptying of the bladder and uterus. Adhesions prevent rotation. The tumor rotates toward the middle line nearly always. In regard to the rotation of viscera, the author has found the cæcum rotated on itself in autopsies but the rotation did not affect the fæcal current. In experiments on dogs he tried to produce axial rotation of the sigmoid flexure—volvulus—but it always unwound itself and he never could retain the volvulus even by suturing it. The author states that however black cysts with twisted pedicles appear, they never show gangrenous tissue unless they have been tapped. In the diagnosis one of the first points is the previous existence of a tumor. The next matter is that the abdomen slowly or rapidly enlarges. The onset of the actual rotation may be sudden abdominal pain, fainting, pallor or nausea. If the woman be pregnant and also has a tumor, then torsion may be considered.

The treatment of axial rotation is abdominal section promptly applied. It is peculiar that most of the tumors that have been twisted on their axis till they have been twisted off their pedicles have been dermoids.

**A Plea for the Appropriation of Criminals, Condemned to Capital Punishment, to the Experimental Physiologist,**

is the title of a most remarkable paper by Dr. J. S. Pyle. The author thinks that a great advance would be made in medical science, and especially in brain surgery, if experimentation were allowed on condemned criminals. Various portions of the brain could be stimulated and the different centers of motion and thought more accurately localized.

"To secure co-operation and carry out the experiment successfully the condemned would be instructed with the nature of the work, assured that no torture would be instituted; that the preparation of removing a piece of the skull and cerebral membranes should take place under the influence of an anæsthetic; and, while he should be allowed to regain consciousness to be interrogated, that no pain would be occasioned thereby; lastly, that his death should occur when in a profound sleep. This would, it would seem, remove the appearance of revenge and barbarity and convert such an occasion into one of real utility both socially and scientifically."

"The State would be doing its duty to take up this matter and make the new form of execution a recognized law. In this, crime would be punished, society protected and loss compensated. The outcome would be a very important one to criminal law, as the manner of arriving at the grounds for requiring the death punishment would be entirely changed and it is believed highly satisfactory. Death would be enforced as an obligatory measure. The criminal, instead of dying the death of a felon, would redress his offense to the State and society by offering himself as a public benefactor. He would stand to be tried as to whether he should pay society for the loss it had sustained and the State the expense of a fair and impartial trial." A building should be specially erected for the purpose and equiped with every form of physiological apparatus required. The executions should be under the charge of an expert body of physiologists and results of the experiments should be published in a report at the conclusion of each execution.

[The author believes that the chief opposition to his scheme will come from morbid sentimentalists. The editor of this department will probably be classed as such by the author, but it would seem to him better to abolish entirely the death penalty than to add to its horrors those of the visvisection table.—ED.]

Dr. C. E. Ruth reports a case of

**Excision of the Cæcum; Approximation of the End of the Ileum to the End of the Colon with the Murphy Button,**

in a patient five and one-half years old. The author states that this is the first excision to his knowledge, in one so young, for intestinal obstruction due to neoplasm; and the first in which the Murphy button has been used to make an end to end junction of the ileum to colon with excision of the cæcum, in the

human subject. The patient made a good recovery. The author presents the following facts in favor of the Murphy button:

1st. It furnishes the strongest junction known.

2nd. We do not need to wait five days to get strong union; it is immediately obtained with proper approximation of the segments.

3rd. In urgent cases nourishment can be commenced at once, which would be scarcely thought of in connection with any suture or plate device.

4th. No foreign body is left permanently in the walls or caliber of the gut to cause subsequent trouble.

5th. In anastomoses between the gall bladder and duodenum; in the formation of biliary, gastric, or fæcal fistulæ, externally, and by Bacon's method of treating non-malignant strictures of the rectum, it leaves nothing to be desired.

6th. If circular enterorrhaphys, *undoubtedly the ideal approximations*, are ever justifiable, it is by this means, as it minimizes the objections urged against the operation, viz.,—weakness at the mesenteric attachment and subsequent contraction.

7th. The union can be made in less time than by any other means, thereby greatly lessening the primary mortality.

The article is illustrated by two wood cuts showing the removed cæcum.

Dr. W. W. Grant discusses the "Indications for and Value of the Uterine Curette," advocating the use of the dull tubular spoon-curette with full antiseptic precautions.

Dr. John I. Skelly, in an article on "The Country Doctor," pays an eloquent tribute to the practitioner living out of the cities. He points out that the country doctor is the father of ovariotomy and of many other operations and also that he has added much to our knowledge of materia medica.

---

The Tri-State Medical Journal is a newcomer among the ranks of medical magazines. It has our hearty good wishes for success.

---

# PERISCOPE.

IN CHARGE OF WILLIAM H. BRICKER, M. D., B. SC.

## THERAPEUTICS.

### Modern Pathology and the Pathology of Nervous Diseases, with some Therapeutical Deductions and Experiments with Organic Extracts.

Charles L. Danna, A. M., M. D. (*Bost. Med. and Surg. Jour.*): The author sums up as follows:

1. The term inflammation has to be applied more carefully and with restrictions to nervous diseases. Many forms or cases of meningitis and myelitis are toxæmias or processes secondary to mechanical injury. There cannot be inflammation without specific cause. 2. In the organic neuroses of degenerative type there is a toxine of extrinsic or intrinsic origin, which is negatively chemotactic. The body cells and proteids cannot defend the special parenchyma against it. The degenerations, including muscular atrophies and primary sclerosis, are of toxic origin. There is a poison at work which it should be the effort of neurological science to antagonize and combat. 3. In the chronic neuroses of functional origin, so called, such as paralysis agitans, chorea, epilepsy, and Basedow's disease, there is a toxic factor which is of fundamental importance. This may be due to defective gland action, as in Basedow's disease and in myxœdema, or to humoral poisons of other origin. Many neuroses are really glandular or nutritive or infectious diseases. 4. Another element of equal importance in the etiology of the neuroses is an inborn or acquired lack of resistance to injurious agents, whether engendered within or introduced from without. This diminished power is in some instances produced by strong emotions and shocks, and the nerve-centres become susceptible to the action of poisons which continue and keep up the disease. Hence in treating the chronic neuroses two kinds of measures are to be employed: first, those which increase the strength and resisting powers of the organism; second, those which are of antitoxic or specific character. There are probably specific cures for many diseases which we now regard as hopeless. 5. The toxic origin of myxœdema has been established, and made probable in exophthalmic goitre, paralysis agitans, and chorea, and the importance of a toxic element has been shown in epilepsy. 6. By the term toxine is meant the product of defective metabolism, due either to defective gland action, microbic growth, or the extrinsic vegetable and mineral poisons.

---

### Effect of Pilocarpine in Changing the Color of the Hair.

D. Webster Prentiss (*Epitome of Medic.*, 1893): Having used pilocarpine with great success in a case of uræmia, Dr. Prentiss was much interested by its effect on the patient's hair. The drug was administered by the hypodermatic method in doses of one centigramme, and the total amount injected (in two or three days) was forty centigrammes. The hair, which previous to this time had been a light brown, began rapidly to change its color to dark brown, and later became black. It also became coarser and thicker. These changes occurred not only in the hair of the head, but also in that of the other parts

of the body. The author states that two similar cases though less marked—have been recorded; and speaks of the occasional effect of pilocarpine in promoting the growth of hair to a marked extent.

## MEDICINE

### The Relation of the Patellar-Tendon Reflex to some of the ocular Reflexes Found in General Paralysis of the insane.

Dr. Charles A. Oliver, presents the following formulation.

1. In some of the cases in the second stage of the disease, especially where the patellar-tendon reflexes were unequally exaggerated, there appeared to be an irregular and unequal spastic ennervation of the two irides, causing irregularities in pin-point pupil forms.

2. In a few cases, especially in the third stage of the disorder, where the patellar-tendon reflexes were unequally diminished, the pupil-size though small and its shape though somewhat irregular, seemed to be but little acted upon by any powerful mydriatic.

3. In many cases, especially in comparatively young subjects in the third stage of the disease where the patellar-tendon reflexes were unequally diminished there appeared to be an unequal paralytic ennervation of the two irides; the pupillary dilatation manifesting itself at times, though not as a rule, in the eye with the greater amount of objective optic-head degeneration and retinal change.

4. In a few cases (especially in men beyond middle life) in the third stage of the disorder, where the patellar reflex were markedly diminished and where the ataxias were quite pronounced, there were marked temporary assymetries of pupillary form, one often being quite small and irregular for several examination, whilst its fellow was large and ovoid or oval.

5. In quite a number of cases, especially in the advanced stages of the disease (although seen in a number of cases in their earliest stages) where the patellar-tendon reflexes were unequally exaggerated or diminished, there was a failure of the irides to respond to even major degrees of light stimulus; this being true not only for those subjects exhibiting a true spastic myosis but more especially shown in those instances where with partial dilatation of the pupil, mydriatics failed to act.

6. In many instances, especially in the older cases where the patellar-tendon reflexes were, as a rule, unequally diminished or even lost, there was not only failure of iris-response to the strongest light stimulus carefully thrown upon the retina, but where obtainable, the irides seemed to fail to react to the various coarse and rough subjective and objective procedures necessary to be used in order to evolve both separated and associated efforts for accommodation and associated efforts for convergence.

7. In some instances, where ciliary muscle innervation could be satisfactorily obtained, both the spastic excitation and the paralytic enervation at times found by subjective reading tests and objective study with the retinoscope, seemed to be in direct ratio with the patellar-tendon reflexes as the iridic changes.

8. In quite a number of cases where there was marked inequality of the pupils with more or less want of reaction of the irides to light stimulus the patellar-tendon reflex on the side of the larger pupil seemed to be the one the more greatly diminished.

9. In a number of instances, especially during the very earliest stages of the disease, where the patellar-tendon reflexes were beginning to lessen to unequal degrees, there often appeared momentary secondary ataxic dilatation of the pupil during exposure to strong light stimulation.

10. In many cases, especially during the second stage of the disorder, when the patellar-tendon reflexes began to become irregular and inconstant, pupillary inequalities as expressive of unequal iris innervation and action, becomes more and more constant.—*Bost. Med. and Surg. Jour.*

### Subcutaneous Injections of Salol in the Treatment of Tuberculosis.

According to the *Jour. de Med. de Paris*, Grasset has obtained very satisfactory results in the treatment of tuberculosis by the subcutaneous injection of salol. The advantages claimed are the decrease in the fever and night-sweats, with a simultaneous moderation of the cough and the number of bacilli. He employs salol with oil in the following mixture:

℞ Sweet oil..... ʒi.
Salol..... ʒiiss.

This is given with a syringe which contains five drachms. The injection is made underneath the skin, and Grasset asserts that within twenty minutes after its use salicylic acid may be obtained from the urine. The injections should be given in those portions of the body where the subcutaneous tissues are loose, as there is always slight induration produced, which, however, shortly passes away.

### Observations on the Nature and Treatment of Angina Pectoris.

After an interesting discussion of the subject heading this article, Dr. J. Burney Yeo (*Practitioner*), reaches the following conclusions:

The true indications for treatment in angina pectoris may be thus summarized:

1. To maintain or improve, when defective, the general nutrition; to avoid all strain, physical and emotional; and so to relieve cardiac feebleness and excessive effort.

2. To relieve dyspeptic conditions and flatulent or fæcal distention of the stomach and intestines.

3. To forbid the habitual comsumption of agents which may exercise a toxic action on the heart, such as tea, coffee, tobacco,

alcohol, etc., or that may introduce or develop toxines in the alimentary canal.

4. To avoid and remove all gouty and other bloody contaminations.

5. To give such tonic remedies as may improve the cardiac tone and lessen existing tendencies to cardio-vascular degeneration.

6. To relieve the paroxysmal attacks by sedatives and stimulants.

### The Treatment of Diabetes.

Dr. George Harley (*Br. Med. Journ.*) divides diabetes into the following varieties:

1. Hepatic diabetes—including the gouty variety.

2. Cerebral diabetes—including all cases of saccharine urine arising from nerve derangements.

3. Pancreatic diabetes—the most deadly form of the disease.

4. Hereditary diabetes—a form by no means uncommon, and one where both brothers and sisters may labor under the disease without either their maternal or paternal parent having been affected by diabetes, though more distant members of the family may have suffered from it.

5. Food diabetes—including all forms of saccharine urine arising from the injestion of unwholesome substances.

### Diabetes in a Baby.

MM. Duflocq and Dauchez report a curious case of death from diabetic coma of an infant of only eighteen months of age. When M. Dauchez first saw the child on January 6, 1893, he found it had been peevish and uncomfortable for only about a fortnight. It was very thin, weak, and of somewhat venous tint, and its discomforts were attributed by its parents to its teething, but to the doctor's ear the history of constipation sounded more serious. He gave it gentle purgatives and stimulants, and did not attribute any special importance to the mother's statement that it was drinking more than four pints of milk a day. Next day it was much weaker and more cyanotic, and the temperature had sunk to 96° F. More energetic measures were taken; it was wrapped in cotton wool and given punch, ammonium carbonate, and an enema of coffee. M. Duflocq was called in and found the baby comatose, with lost corneal reflex, quick breathing, and dry tongue. It did not feel the injections of ether, and in a few hours was dead, *i. e.* in less than thirty-six hours from the time when medical advice was first called in. The possibility of diabetic coma was recognized, and a little further search showed white powdery patches on the napkins and bed-linen, and an abundant amount of glucose by further chemical analysis. Dr. Conolly has recorded (*Med. Times and Gaz.*, July, 1874) a very similar case in a child of twenty-one months, with marked constipation ending in sudden coma; and instances have been given by Busch (*Ugeskrift for Læger*, March 24, 1875,) Hauner, and Rosebach (*Berl. klin. Woch.*, 1874), at a still earlier age. In the two last cases, however, death resulted from exhaustion rather than from coma. Hagenbach relates another case where death came on from pulmonary gangrene in a child of 6 months. There is one case to quote of recovery, in a little baby of Dr. Kitselle's, who was made out by his father within a fortnight of his birth to have diabetes, but who got over it by the time he was eight months old under careful treatment. (*Revue de Med.*)—*The Practitioner.*

### Changes and Degenerations in Nævi.

Reboul (*Archiv. gen. de Med.*, May to October, 1893) says that nævi are tumors which are congenital in their origin, and on this account they are able to give rise to the formation of a variety of benign and malignant tumors. In a considerable number of cases they disappear spontaneously after birth, but in others they remain apparently stationary, and then they must be carefully watched so as to detect any changes which may take place in them. Whenever the least sign of extention, transformation, or malignant degeneration appears, it is necessary at once to adopt active measures, and to remove them freely. When they undergo malignant degeneration, especially of the melanotic variety, they must be regarded as infectious, and in the performance of operations for their removal, every precaution must be taken which will tend to prevent a local infection, which may become the point of commencement of a generalization of the growth, and hence lead to a fatal termination.

## SURGERY.

### Amputation for Diabetic Gangrene.

Mr. Pearce Gould amputated by Stephen Smith's method the right leg of a man, aged seventy-four, for gangrene of the three inner toes extending into the sole and slowly spreading; the arteries were atheromatous, the amount of urine passed per day was from seventy to eighty ounces, in which there were eight and three-quarter grains of sugar to the ounce. this amount, however, was reduced to six grains per ounce by restricted diet; the patient was edentulous, the skin was dry, and there was right cataract. After removing the limb Mr. Gould remarked that diabetes used to be considered a bar to operation, but more recent experience has shown that with asepsis operations may be safely performed, and often with great advantage on patient afflicted with this malady. He said the connection between diabetes and gangrene seemed to be threefold:

1. Senile gangrene from atheromatous arteries in a diabetic.

2. Acute spreading gangrene due to the diminished resistance of the tissues of diabetics to septic processes.

3. Gangrene from trophic changes.

In the first two forms amputation, he thought, should be remote from the disease,

such as through or above the knee for gangrene of the toes; but in the third form he considered the operation may be performed just above the dead tissues.

He referred to a case in which he had amputated through the knee for spreading cellulitis and gangrene about the ankle in a diabetic patient who had made a good recovery, and from whose urine the sugar disappeared a weak after the operation.—*Med. Press and Circular.*

### Duncan (J.) on the Surgical Treatment of Gall-Stones.

The conclusions which he draws from his experience in the surgical treatment of gallstones are,—

1. That when the stones lie in the gallbladder or lightly impacted in the cystic duct, cholecystotomy is a safe and esay operation.

2. That if the stone be impacted in the common duct, the gall-bladder is apt to be small, and such structures as the stomach and colon are prone to be adherent in awkward positions.

3. That in such cases it is safe to incise the duct and drain from the wound.

4. That considering the perfect health enjoyed by patients wite biliary fistula, there are few cases in which it would be justifiable to form a new route for the bile into the bowel.—*Edinburgh Mee. Jour.*

### Antiseptic Varnish—Steresol.

Berlioz (*Jour. de Med. et de Chir Pratiques*) prepares an antiseptic varnish, which he terms steresol, by mixing the following ingredients:

℞ Purified shellac, 279 grammes;
Purified benzoin, entirely soluble in alcohol, 10 grammes,
Balsam of Tolu, 10 grammes;
Crystallized carbolic acid. 100 grammes;
Chinese essence of canella, 6 grammes;
Saccharine, 6 grammes;
Alcohol enough to make a litre.

This dressing is employed in regions which cannot be bandaged in the ordinary fashion.

### The Toxic Effects of Gallic Acid.

In a recent issue of the *New Zealand Medical Journal*, Dr. Thomas W. Bell contributes an interesting clinical note as to the possible poisonous effects of this remedy, which is regarded as harmless in anything like moderate quantities. A man, aged thirty-two, with internal hemorrhoids, has a venous oozing with each passage of the bowels; various applications, including iron and cold water, had been used without any permanent benefit. One morning, just after an evacuation, he applied to the bleeding pile some ung. gallæ cum opio (B. P.). The piles were not painful and on their being replaced all discomfort ceased. After a little while he had for the first time in his life a slight attack of hay asthma, which was referred to the probable inhalation of some irritant dust. Three or four days later, after a second use of the ointment he had a similar asthmatic attack, followed by an urticaria lasting three or four hours, but no relation of cause and effect was thought to exist between the remedy and the subsequent outbreak. As the hemorrhage still persisted after each motion, Dr. Bell ordered a three-grain tannin suppository a short time before and after each movement of the bowels. The sequel is stated by Dr. Bell as follows: "In the afternoon, feeling quite well, he inserted a suppository. In about four minutes the symptoms of the asthma began to show. I watched the case throughout. First, there was pain and a tight feeling under the sternum, and a trouble in breathing; the breathing got quicker and labored, accompanied with wheezing and an occasional cough—until, in about half an hour from the time when the suppository was introduced, all he could do was to lie on the bed gasping and straining for breath, face flushed, hot, and perspiring, rales and rhonchi all over chest, and pain on coughing. With each cough a little pellet of mucus was expelled. This condition lasted for another half-hour, and then the pain and rapidity of breathing began to subside, but then the attack of urticaria commenced. Starting about the head and neck, it extended all over the body, and became especially marked about the feet. The irritation and itching was intense. Some of the wheals were from two to three inches in diameter. At the end of about four hours the cough had stopped, the breathing had returned to normal, but the irritation of the skin continued in a less degree till next morning. The patient had never had any asthma, or anything approaching it, before or since, nor have any of his relatives ever had anything of the kind. Nor has he ever had urticaria or any skin eruption whatever." The physician was at a loss to account for these phenomena except as the effects of the gallic acid. No such results followed the use of various other remedies. None of the standard text-books attribute toxic qualities to gallic acid, either in the line of vaso-motor disturbance or that of skin eruption. Some peculiar idiosyncrasy seems to have existed in this patient.—*Medical Record.*

## GYNECOLOGY.

### Influence of Mineral Baths in Normal and Pathological Menstruation.

Most balneologists regard menstruation as a contra-indication for baths, and these are discontinued during that period at every bath-cure. However, the investigations of Makaveyef show that in abnormal menstruation and in diseases of the sexual organs mineral baths should be continued, since they improve the general condition of the patient, diminish and shorten abundant menstruation, and augment a scanty flow. Artificial salt baths, according to the author, may be employed for the same purpose, their effect being similar. They are to be recommended to cause contraction of the womb and diminish the quantity of blood in it.—*Vratch*, Nos. 24 and 25, 1893.—*Universal Med. Jour.*

### Williams on Papillomatous Tumors of the Ovaries.

The author groups together, as follows, the salient features of the two forms.

1. Most papillomatous cystomata are not developed within the broad ligament, the majority of intraligamentous papillomatous growths being of other than ovarian origin.

2. These growths are derived either from the Graafian follicle or germinal epithelium; their origin from the Wolffian body or from the tubal epithelium, while possible, has yet to be demonstrated.

3. As the origin of both the ciliated and non-ciliated papillomatous growths is identical, there is no justification for considering them as constituting two distinct classes of growths.

4. Polymorphism of the epithelium is not characteristic of ciliated papillomatous growths.

5. The formation of psammoma bodies is not pathognomonic of the ciliated papillomatous cystomata, for they occur in the superficial and non-ciliated varieties, and also in the normal ovary and tube, as well as in other parts of the body.

6. Superficial papillomata are of far more frequent occurrence than is generally supposed.

7. They are very closely related to the papillomatous cystomata, and are always derived from the germinal epithelium.

8. All varieties of papillomatous growths of the ovary have a marked tendency toward the formation of secondary growths. The majority of secondary growths are produced by mere extension of the growth by continuity of tissue, or by implantation of small particles of the tumor upon the peritoneum. In rare instances, true metastases may be formed.

9. The papillomatous tumors possess a marked tendency to become malignant, and even the anatomically-benign growths, in view of their tendency to the formation of secondary growths, are to be considered as clinically malignant.

10. The results of operations, even after the formation of secondary growths upon the peritoneum, are quite satisfactory.—*Johns Hopkins Hosp. Rep.*, vol. iii., 1893.

---

### Suture After Laparotomy.

Howitz, of Copenhagen, at the recent Surgical Congress held at Gothenburg, discussed the comparative value of the methods and kinds of sutures which are used after laparotomy. According to him the abdominal hernia which occasionally occur after operation are dependent upon the manner in which the sutures are applied. Three factors determine the strength of the cicatrix: (1) The nature of the uniting surfaces; (2) the manner in which they are held together, and (3) the kind of suture used. As regards (1) the incision in the linea alba is not advantageous, since the conditions required for the formamation of a sound scar are not present. In order to form a strong cicatrix the opposing surfaces of the incision must be fairly extensive and smooth, they should contain only a small amount of fat, and should be in apposition without much tension. In order to secure this condition of affairs the author advises that the incision should be made about two-thirds of an inch from the middle line, passing through the substance of the rectus muscle. As regards the method of suturing, he recommends the twisted suture, such as is used for harelip. In applying the suture a slightly curved needle is used, and only a small amount of peritoneum included in the suture. The sutures are made from silkworm gut. After the operation the patient is kept in bed for three or four weeks, so as to allow the scar to become firm.—*Sem. Med.; Brit. Med. Jour.*

---

### Extra-Uterine Pregnancy.

Dr. G. Haven, in *Bost. Med. and Surg. Jour.*, says: The following symptoms suggest ectopic pregnancy:

1. The absence of menstruation, or a flow coming at irregular intervals, and of uncertain duration.

2. Pain of a severe and spasmodic character, which may be permanent at first, then absent for some weeks, to return later with renewed vigor.

3. Vaginal discoloration—a symptom of some importance, yet often noticed in cases where some other form of pelvic tumor is present.

4. General signs of pregnancy, such as nausea, enlarged and tender breasts, increase in size of the papillæ, darkened aureolæ, milk in the breasts, *ballottement*, the presence of a tumor, irregular menstruation, and, possibly, gait.

5. The history of having had a child or miscarriage. This is important, as cases occuring in nulliparous women are rare.

6. Expulsion of decidua. This symptom is of great importance, although in the majority of cases we are not fortunate enough to have it present, the clot and shreds of tissue are thrown away before a microscopical examination can be made.

7. Increase in size of the uterus, with the fundus either pushed forward or to the right or left side.

8. Elongated, soft, and patulous cervix.

9. The appendages on one side containing a thin-walled and tender cyst. The fact, however, that a tumor is felt upon both sides should have no bearing upon the diagnosis, as one of the tumors may be due to extra-uterine pregnancy, and the other to some other form of tubal, ovarian or pelvic trouble.

10. Pulsation of vessels in neighborhood of cyst.

11. The rapid increase in the size of the tumor.

12. Presence of fetal heart sounds.

13. Presence of placental bruit.

14. Feeling the small parts of the child, either through the vagina or rectum, or by combined manipulation.

With diagnosis made, the right policy is to operate.

## OBSTETRICS.

### Helme (T. A.) on the Composition of the Fœtal Urine Secreted in Utero.

1. The fœtal kidneys secrete actively during intrauterine life.
2. The urine of the normal living fœtus contains urea.
3. The urine of the normal living fœtus contains kreatinin.
4. The fœtal renal excretion is a possible source of origin of the liquor amnii; this is shown by the presence of urea and kreatinin in both these fluids.
5. The presence of sulphates and phosphates in the liquor amnii, and their absence from the fœtal urine, would point to there being an additional source of origin of the liquor amnii.

### The Dangers and Avoidance of Ergot in Obstetrics.

In the *Columbus Med. Jour.*, Crosslands has an article upon this subject, in which, after quoting his own experience and the instructions given by the standard text-books, he reaches these conclusions:

Ergot is extensively used to prevent an imaginary danger. In cases where its use seems most indicated, better results are obtained without than with them.

Its positive action blinds us to its possible dangers. The evil it does is often credited to other causes.

Administered, it is a potential force over which we have little or no control.

When the natural forces are insufficient, there are other means which are efficient, harmless, and controllable.

When all other means fail, forceps is the final resort for delivery through the natural passages.

## ARMY AND NAVY.

U. S. ARMY, FROM NOVEMBER 26, 1893, TO DECEMBER 2, 1893.

First Lieutenant Alexander N. Stark, Assistant Surgeon, U. S. Army is relieved from duty at Fort Clark, Texas, and will report in person to the commanding officer, Fort Sam Houston, Texas for duty at that post.

Forty-seventh semi-annual meeting of the Northwestern Ohio Medical Association will be held at Toledo, Ohio, Thursday and Friday, Dec. 14 and 15, 1893.

Session to be held in Y. M. C. A. Rooms, Cor. of Oak and Summit Sts.

## NEWS AND MISCELLANY.

### Improved Service to Cincinnati & St. Louis.

The Baltimore & Ohio Southwestern Limited, leaving Market Street 11.26 A. M., and the fast Express, leaving at 9.58 P. M., and leaving 24th and Chestnut Streets 11.42 A. M. and 10.15 P. M., for Cincinnati and St. Louis, are now equipped with a complete Dining Car service, built expressly for these trains by the Pullman Company. Pullman Dining Cars are also attached to Royal Blue Line trains leaving Market Street 11.26 A. M., 7.22 P. M., and leaving 24th and Chestnut Streets 11.42 A. M., 1.35 and 7.38 P. M. daily for Baltimore and Washington.

### Of Interest to Travelers.

The Baltimore and Ohio Railroad announces that they have placed on sale round trip tickets at reduced rates to the Winter Resorts in Florida and the South, and also to such points of interest as Luray, Natural Bridge and Gettysburg. This company has also arranged to place on sale excursion tickets to San Francisco and other points in California on account of the Mid-Winter Fair, at unusually low rates. Excursion tickets are now on sale to Baltimore and Washington via the famous Royal Blue Line.

With its vestibuled train service via Washington to Cincinnati, St. Louis and Chicago, the B. & O. is in the best of condition to handle western and southern travel. That the line is a popular one, is attested by the immense World's Fair business handled this summer.

Those contemplating a trip west or south this winter, should write to James Potter, Div. Pass. Agent, B. & O. R. R., 833 Chestnut St., Philadelphia, Pa., for rates and other information.

### Reduced Rates for the Holidays.

In pursuance of its liberal policy, the Baltimore and Ohio Railroad Company announces that excursion tickets will be sold between all stations on its lines east of the Ohio River during the Christmas and New Year holidays at reduced rates. The tickets will be sold for all trains December 23, 24, 25, 30, 31 and January 1, and will be valid for the return journey on all trains until January 3 inclusive.

### Through Cars to New Orleans.

Among the many important improvements in the Baltimore and Ohio Railroad train service is the addition of through pullman Sleeping Cars from New York to New Orleans, via Philadelphia, Baltimore, Washington, and the famous Shenandoah Valley route, passing through Roanoke, Knoxville, Chattanooga and Birmingham. The train leaves New York daily at 5.00 P. M.; Philadelphia, 12th and Market Sts., 7.22 P. M and 24th and Chestnut Sts. 7.38 P. M., reaching Roanoke at 7.50 A. M.; Knoxville, 3.52 P. M., and New Orleans, 12.45 P. M.

This train is very handsomely appointed, being vestibuted throughout, and has Dining Car service New York to Chattanooga. At Washington a Pullman Sleeping Car, which runs through to Memphis, is added to the train.

**Pharmaceutical Products of the Farbenfabriken vorm Friedr Bayer & Co.**

**Phenacetine-Bayer**

ANTIPYRETIC and ANALGESIC; Prompt, safe and effective in Fever, Influenza, Rheumatism, Neuralgia, Pneumonia, Cephalalgia and all forms of pain.

Phenacetine is given in doses of 2½ to 10 grains, 3 or 4 times daily. It does not depress the heart.

Phenacetine is supplied in ounces, also in tablets and pills, alone and with Salophen, Sulfonal, etc.

**Sulfonal-Bayer**

HYPNOTIC and SEDATIVE; Indicated in all the Insomnias including those of insanity and the Neuroses; Causes no nervous or gastric disturbances. Must be given as directed.

The dose of Sulfonal varies from 15 to 45 grains; It should be given an hour or two before bedtime.

Sulfonal is supplied in ounces, tablets and pills; also in tablets in combination with Phenacetine.

*Other Farbenfabriken Products:*

**Salophen, Trional, Aristol, Losophan, Piperazine-Bayer, Europhen.**

### GASTROSTOMY BY WITZEL'S METHOD FOR PRIMARY CANCER OF THE ŒSOPHAGUS.*

WILLIAM W. KEEN, M. D.,† Philadelphia.

The patient, S. S., aged forty-eight, occupation puddler in rolling mills, was admitted to the Jefferson Hospital July 31, 1893, at the request of Dr. A. G. Miner, of Niles, Ohio. His father died of asthma, his mother of cancer of the breast. He has always had good health with the exception of an occasional brief attack of rheumatism. For the past thirteen months he has experienced trouble in swallowing; seven months ago he could swallow solid food without much discomfort, but now he can swallow nothing but liquids. He states that the constriction came on gradually and that he noticed from time to time the lessening of the calibre of his œsophagus. When he takes nourishment he feels first an impediment to the passage at a point corresponding to the sterno-clavicular articulation; then the food passes with comparative ease until it reaches a point which corresponds to half an inch above the lower end of the ensiform appendix. Here he says he can feel a distinct obstruction, and while the food is passing this point he experiences pain in the median line posteriorly, under the inferior angles of both scapulæ (more severe under the left), in the epigastric region, though slight, and in the precordial region. The pain is darting in character.

During the past four months he has had slight attacks of hematemesis. On July 27, 1893, he lost considerable blood, enough to make him faint, but he attributes this to the introduction of an œsophageal bougie. He has had gradually increasing emaciation, and has lost forty-nine pounds in the last thirteen months, his weight in June, 1892, being 168 pounds, and in July, 1893, 119 pounds. During the last ten weeks he has had œsophageal bougies passed twice a week. On the 31st of July I passed a No. 3 rectal bougie through the stricture.

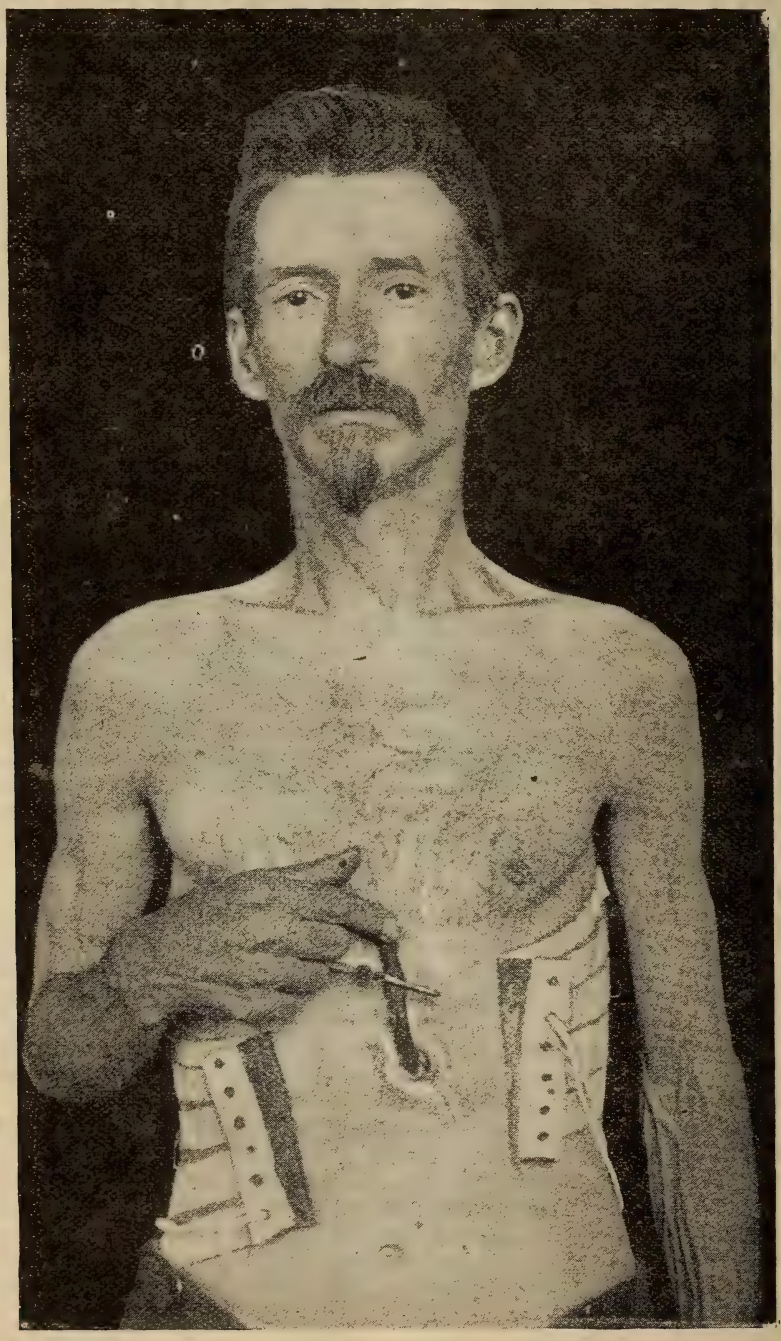
He has never swallowed any corrosive fluids, and has had no traumatism. He does not indulge in alcoholic stimulants stronger than beer, and limits this to two or three glasses a day. He denies all history of syphilis. His appetite is impaired, tongue coated and bowels constipated. The urine is negative.

There is a resistance in passing the œsophageal bougie (circumference 4.2 centimetres) at ten and a half inches from the teeth, and at twelve inches the bougie would not pass.

Operation, August 2, 1893. An incision four inches long was made, beginning at the middle line and running to the left, a finger's breadth below the border of the ribs. The muscular fibres of the rectus were separated by the fingers and not divided. The liver was seen as soon as the peritoneal cavity was opened. Two fingers thrust in, however, very readily seized the stomach. This was brought

* Read before the Philadelphia Academy of Surgery.
†Professor of The Principles of Surgery and of Clinical Surgery, Jefferson Medical College.

forward and outside the wound, the margins being packed with gauze. A rubber tube, five inches in length (Size 25, Fr. The opening in the stomach was made toward the cardiac extremity and the tube lay parallel to the external wound, its ex-



catheter scale), was introduced into the stomach and infolded by two rows of Lembert sutures, after Witzel's method. ternal end emerging near the median line. Three stitches were now inserted into the walls of the stomach but not tied before

it was returned to the abdomen, their needles being left threaded. As soon as the stomach was returned these needles

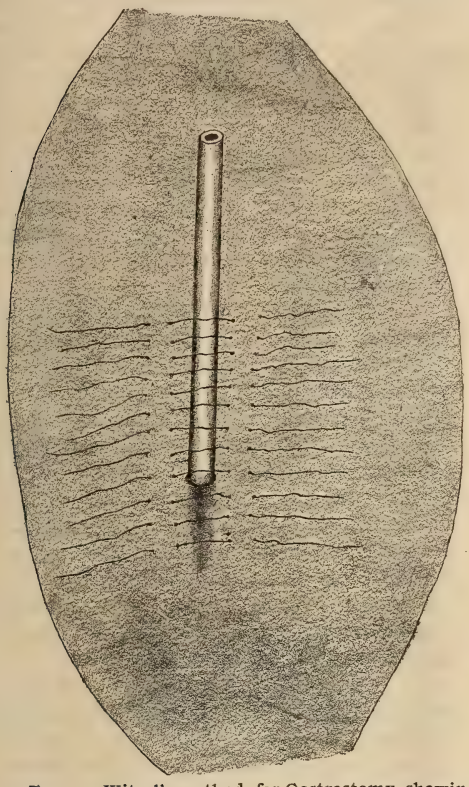


FIG. 2.—Witzel's method for Gastrostomy, showing application of sutures in wall of stomach embedding tube obliquely therein.

were thrust through the abdominal wall and the stomach brought up to the margin of the opening. The tube was retained in place by a catgut stitch passed through the wall of the stomach and through a part of the wall of the tube so as not to open its calibre. About one inch of the tube was thrust into the stomach. The edges of the abdominal opening were now sutured by silkworm-gut and the ordinary dressing applied. A clip was placed on the tube to prevent the escape of the contents of the stomach.

September 28, 1893. The patient made an excellent recovery, without incident, excepting in one respect. On the second day after the operation the dressing became twisted in his movements in bed, and the tube was pulled out of the stomach. In order to replace it I was obliged to cut three stitches in the external wound. When the tube had been replaced these stitches were re-inserted. Apparently, however, such adhesion had formed that no harm was done by this accident excepting to delay the closure of the wound.

By the middle of September he began to expectorate some bloody mucus, presumably coming from the ulceration of the carcinoma in the œsophagus. He has gained about four pounds in weight, however, since the operation. For some weeks he has been unable to swallow even a mouthful of water. What nutritive gain there is from feeding, I presume has been almost counteracted by the progress of the disease. Immediately after the operation he was fed for two days by rectal enemata. Then I began with small amounts of milk, poured into the stomach through the tube. This feeding has been gradually increased, until at the present time his daily food may be summarized about as follows: Milk, two quarts; beef, mutton and chicken broth, each about twenty ounces; and a dozen eggs. This is varied by substituting gruel, thin custard and other similar food. He is walking about with much comfort. The tube is held in place by a gauze dressing, which in turn is retained by rubber

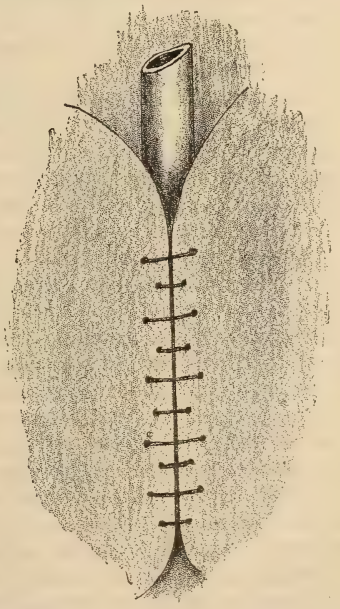

Fig. 3.—Sutures tied completely embedding tube for some distance.

adhesive plaster on each side. This is laced through eyelet holes. (See Plate, Fig. 1). No escape of the gastric contents has taken place alongside of the tube.

November 1, 1893. The patient is still doing well three months after the operation. There is absolutely no leakage whatever.

Greig Smith states that the operation of gastrostomy was first proposed by Egebert, a Norwegian surgeon, in 1837, received its name from Sedillot, in 1846, but had a very unsatisfactory history and development until the time of Sidney Jones, of St. Thomas' Hospital, London, in 1874. Since then it has made rapid progress in favor in the profession, and a variety of different methods of its performance have been devised, until now its technique is presumably so satisfactory that but little improvement can be made upon it. The conditions which demand the operation are, of course, any cause which prevents the introduction of aliment into the stomach by the mouth, for instance, stricture of the œsophagus from any reason, whether by cancer, cicatricial constrictions from caustics, etc., occasionally from the pressure of extra-œsophageal growths, or from malignant disease in the mouth or pharynx. Whitehead[1] has reported a case in which gastrostomy was done on account of obstruction due to a diverticulum.

There are practically five methods by which gastrostomy is done.

1. The method originally proposed by by Egebert, and modified in its details by Fenger and Howse.[2] In this an abdominal incision is made parallel with the border of the ribs, and the stomach is attached by sutures to the abdominal wall. Two sutures are placed in the wall of the stomach in order later to identify the exact position for puncture (Bryant), and the stomach is not opened until the third or fourth day. This method has given rise to so much trouble, however, especially from leakage, that various devices have been employed for the purpose of preventing this annoyance, which, in consequence of the irritation from the escaping gastric juice, caused wide-spread eczema or even ulceration. Handford[3] notices, for instance, "a hernia like protrusion of the mucous membrane of the stomach from the fistulous opening, forming a red, mushroom-shaped, insensitive mass, nearly two inches in diameter. This was easily replaced, but led to constant leakage of the stomach contents." Moreover, it is very important to observe that in Whitehead's case, above alluded to, the post-mortem showed that the adhesions of the stomach to the abdominal wall had so loosened by traction that they were very slight indeed when the patient died, six months and a half after the operation. Hence, the importance of secure suturing of the stomach to the abdominal wall, as I believe I have obtained in my own case by suturing the stomach to the abdominal wall.

2. The method of Von Hacker.[1] This operator proposed to use the belly of the rectus muscle as a sphincter. In the first method of operating the fibres of this muscle are divided by a transverse incision. Von Hacker proposed to make a vertical incision and a blunt dissection of the belly of the muscle, hoping that the rectus fibres would thus act as a sphincter. Girard[2] modified this by crossing the fibres of the muscle so as to form a more efficient sphincter. Von Hacker himself has been obliged to use the Scheimpflug canula in order to prevent leakage.

3. The method of Hahn.[3] In this a return is made to the original transverse incision, but a second incision is made in the eighth intercostal space. The stomach is drawn through this space, and fastened there between the cartilages. In addition to the danger of possibly opening the chest, necrosis of the cartilages has taken place, although Hahn affirms that there is no danger either to the diaphragm or the pleura. He believed that the cartilages of the ribs acted like a sphincter or stopcock.

4. The method of Witzel.[4] In this method the abdominal cavity is opened, the stomach drawn out, and a moderate-sized rubber tube is inserted into the stomach toward the cardiac extremity, through as small an opening as will admit it. The gastric end is then buried for about two inches by two rows of ordinary Lembert, or Cushing right-angled sutures. The free end of the tube is then brought out through the abdominal wound, and is either fastened there, or possibly after a time may be removed and inserted as

3 Centralbl. f. Chir., 1890, 193.
4 Centralbl. f. Chir., 1891, 601.

needed. [I have thus tried to remove the tube temporarily in my patient but had to abandon it from the difficulty of its reintroduction.] The great advantage of this operation is the ureter-like, oblique entrance of the tube into the stomach; and, as is shown by the post-mortem examination in one of Meyer's cases,[1] the result is a nipple-like protuberance into the calibre of the stomach, which will prevent effectually the escape of any fluids.

This seems to me to be by far the best method yet devised, as it is simple, moderately rapid, and, above all, as in the present case as well as a few others in which the operation has been done, it is effectual in preventing any leakage.

I did not immediately begin feeding the patient through the tube, as I deemed it safer, the patient being in very fair physcal condition, to nourish him for a couple days by rectal enemata. I did, however, introduce an ounce of milk into the stomach the moment the tube was inserted, in order to make sure that perforation of the mucous membrane, as well as the muscular wall, had been effected. I thi k it likely that in another case, with the courage born of experience, I should be disposed to nourish the patient by small amounts through the tube immediately after the operation. I wished to try with this patient a method which has been used by others, the effect of his chewing meat which had been previously finely hashed, and then washing it into the stomach through the funnel. This gives the patient the satisfaction of mastication and of taste, and at the same time mixes the saliva with the food before its introduction into the stomach. Although not a man of especially sensitive nature, the idea of doing this seemed to disgust the patient so much that he was not willing to attempt it. The result, however, shows that he has received sufficient nourishment to gain somewhat in weight. Whether his constant hunger, in spite of the nourishment taken, is due to the want of satisfaction of his sense of taste, I do not know.

5. Frank[2] has reported still another method practiced in the clinic of Albert, in Vienna. After making the abdominal incision parallel with the costal cartilages, a narrow fold of the anterior wall of the stomach is drawn out of this wound. A second incision is next made through the skin, half an inch above the first and over the costal cartilages. After separating the skin from the underlying parts, the fold of the stomach wall is drawn out, first through the abdominal wound, then under the skin, and, finally, through the second opening, and is fixed there, the mucous membrane being stitched to the skin. Whether experience will show this to be more valuable and more easily done than the method of Witzel cannot yet be determined. It is said that no leakage occurs. Of course, as pointed out by the author, it would not be advisable in cicatricial stricture of the œsophagus, because the fistula could not easily be closed, should it be desired to do this at any time.

It is interesting to note that Zweifel,[1] of Leipzig, has used the same process as Witzel in making an artificial urethra. This idea was suggested by Witzel in his paper. In a case of carcinoma of the urethra in a woman, Zweifel extirpated the entire urethra and part of the bladder, closed the latter viscus, and then by a supra-pubic cystotomy made an artificial urethra after Witzel's method.

The mortality of the operation was last collectively investigated by the late Samuel W. Gross.[2] At that time Gross collected 207 gastrostomies, with sixty-one deaths, a mortality of 29.47 per cent., with a prolongation of life, on an average, at the date of the last reports, of eighty-three days.

Comparing gastrostomy with other procedures, there were thirty-two cases of œsophagostomy, with nineteen deaths; a mortality of 59.37, and a mean duration of life of fifty days. Nineteen internal œsophagotomies, with six deaths, or a mortality of 31.57, and an average prolongation of life of 256 days. Five combined œsophagotomies have resulted in two deaths, a mortality of 40 per cent., and a mean duration of life of 168 days. Five œsophagectomies gave three deaths, a mortality of 60 per cent., and a mean duration of life of fifty days. Three retrograde divulsions all resulted in recovery, with a mean duration of life of twenty-two days.

1 Annals of Surgery, 1893, Vol, xvii, 594.

2 Wien. klin. Woch., 1893, No. 15.

1 Centralbl., f. Chir. 1893, 785.

2Trans. of the Amer. Surg. Assoc., II, 1885.

In the case of Handford, already alluded to, some very interesting physiological experiments were made. He introduced a small rubber tube attached to a female catheter into the stomach, and connecting it with a Marey's registering tambour and clock work revolving drum, he found the respiratory and cardiac curves well marked, but absolute absence of any peristalsis. This he accounted for by the adhesion of the stomach to the abdominal wall. Yet digestion was efficiently performed, probably due to the replacement of this motion by the movement produced by the heart and diaphragm. He observes also that "the rapid introduction of large quantities of food into the stomach, the absence of pleasure in eating and the normal perception of flavors are not incompatible with very perfect digestion and active nutrition." Fine division of the food determined its rapid and easy digestion. Lactic acid was found as early as half an hour after eating. Hydrochloric acid was absent until as late as two hours after the meal.

## COMMUNICATIONS.

### TREATMENT OF FRACTURE OF THE LEG.*

J. T. BERGHOFF, M. D., St. Joseph, Missouri.

It has been my fortune for the last twenty years to be called to treat extra severe cases of fracture of the leg. Among them six fractures of the femur which had been treated by other surgeons, but the deformity and shortening were so great that something had to be done to save the patients from being crippled for the balance of their lives. The femur being firmly united, the average shortening is from two to three and one-half inches. The patient was thoroughly anæsthetized, the femur refractured, the fragments properly adjusted, put in my apparatus, and no shortening or deformity could be detected. One particular case I met three years afterwards accidentally, not knowing the patient. He said to me, "Doctor, do you not know me?" I answered, No. "Do you not remember you broke my thigh over; my name is K—. Feel my thigh." Not the slightest thickening at the seat of the fracture could be detected.

In 1892, I was the health officer of St. Joseph. My attention was called to a case, a man 56 years of age, who had been sitting in a rocking chair for 18 days with fracture of his right thigh in the middle third, without ever having been set or dressed in any form. I called on our mayor, Mr. William Shepherd, to go with me to see that case. When we arrived the mayor said to me, "you never will save that leg." I took him to the hospital. The swelling from the toes to the abdomen was so enormous that the fracture could not be felt. By placing the limb in my apparatus for one week, I had the swelling so far reduced as to be able to feel how and where the point of fracture was. The upper fragment had overridden the lower, the shortening being three and a half inches. This was the twenty-sixth day after the accident. The patient being anæsthetized, the bone was properly adjusted and kept in an immobile condition; the leg had to be redressed four times, as the swelling could not be reduced completely. On the forty-ninth day, that is from the day the limb was set, I removed all dressings, and no shortening or deformity could be detected. I applied a silicate potassa bandage. Next day on my way to the hospital I met the patient six blocks away from the hospital on his way home. I tried to persuade him to go back to the hospital as it could not be expected that the bone was solid, but he refused to go back, saying he felt all right.

I have treated compound comminuted fractures of the leg with this apparatus, one case especially that had been under treatment for ten weeks by two other surgeons, when the case became so desperate that they had to give it up. No

* Read before the Missouri Valley Medical Association, October, 1893.

union of tibia or fibula was found. The wound was covered with exudations, and erysipelas extended from the toes to the abdomen. The swelling of the thigh near the abdomen measured 32 inches, at the fracture of the leg, middle third, 24 inches, at the ankle 16 inches. The patient had septic fever. Temperature was 104½°. Patient had diarrhœa, etc. Under the common treatment the patient could not have survived one week. By placing the patient in my apparatus in an immovable condition and applying the proper remedies, both internally and externally, all went on well. In seven weeks the patient was able to be up and about. No shortening or deformity occurred.

I have treated seven cases of compound dislocation of the ankle joint, with fracture of the fibula about five to six inches above the ankle. One of them was also a compound fracture of the tibia, middle third. One of these cases had been treated 30 days by another surgeon, and the dislocation reduced every day for 30 days. The case became so desperate that I was sent for to amputate the leg. The discharge of pus amounted to one-half gallon in 24 hours. The patient had hectic fever, diarrhœa, septicæmia, and lost in 30 days, 60 pounds of weight. Amputation under such conditions was not to be thought of, the whole leg being a suppurating mass. I told the patient to let me treat him for one week so as to endeavor to improve his general condition, and that if the limb could not be saved, I would then amputate it. I placed the patient in my apparatus, adjusted the dislocation and fracture of the fibula, and in a week I had reduced the discharge of pus to about five ounces. Diarrhœa ceased, and appetite improved. In eight weeks the patient was out, but the astragalus had become partly necrosed and was afterwards removed, but leaving the patient with a good servicable foot. These cases had been treated by others as mentioned above. The six other compound dislocations which I have treated from the first all recovered with good joints, no separation ever having occurred. These are the worst cases I have had to deal with. Simple fractures I will not mention.

In treating fractures of the leg, the leg should never rest on the bedding, but should be suspended even if only two inches above the bedding. I care not how well the surgeon may coaptate the broken bone, and protect the same with splints and bandages or plaster-of-Paris, if the limb rests on the bedding, by each movement of the body of the patient the fracture is bound to move. The process of repair is exactly the same as in soft tissues in bone. Why do we have union by first intention? Because we coaptate the wound exactly and keep it so. The wound heals sometimes in three days, at the farthest a week. But to put the broken limb in an immovable condition and keep it so without great suffering to the patient, the profession has not been able to do to the present time.

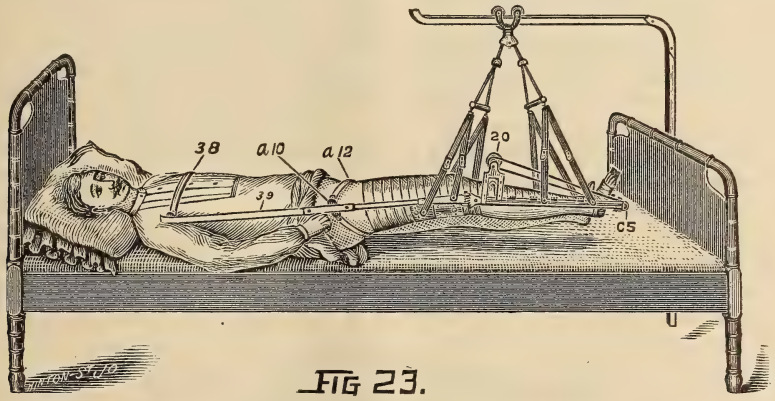

FIG 23.

This universal apparatus or splint is an outgrowth of patient study for 20 years, more particularly the last ten years.

I will now describe my apparatus. The suspension device consists of a half inch steel elbow bar, as shown in Fig. 23, fastened to the foot-board of the bed, either in or outside which can be raised or lowered at will. On this bar are two rollers for sliding up and down in bed.

Below the bar will be seen a swivel joint, giving the patient liberty to move or change his place in bed, or lay on his side, or by placing table of the height of the bed alongside, the patient can move to have his bed made on the first day without disturbing the fracture in the least. The splint proper is of steel, nickel plated, and so constructed that it can be adjusted to any size of limb, long or short, thick or thin. Fig. 23 (38) is for the treatment of fracture of the neck of the femur or intracapsular, the splint extending to the axilla and fastened around the body and by telescope to any length. Fig. 23, A. 10, is a movable hip joint. A. 12, counter-extension bands; from hip to knee, also telescope to get the exact length from knee to foot. The knee joint can be set at any angle by a worm wheel, as seen in Fig. 25. The thigh-rest is of wood, also changeable to any size, seen in Fig. 24. The lower limb rests in a hammock fastened by a series of movable hooks from knee to foot. Over this hammock is placed the many-tailed bandage, also fastened by these hooks, by which any suitable posterior or side splints may be used. The extension device made of a spring coil, as seen in Figs. 23, 24, 25, to be placed on any part of the splint, not coming in contact with the limb, wound up with a key to any tension from one pound to thirty; the cords running from a coil of the spring over pulleys from the foot board which is fastened to the foot in the usual manner.

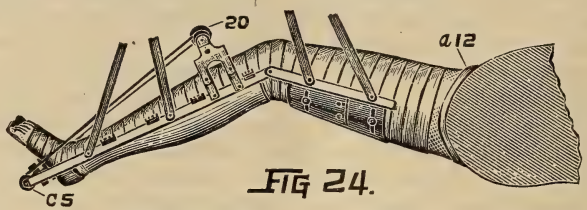

FIG 24.

In fracture of the thigh where no extension is necessary from the foot, the adhesive straps are fastened below the lower fragment and the extension device is put at any place, as seen in Fig. 25 (20-37). When this apparatus is properly applied the limb is immobilized and cannot be injured by the patient if he would. There is no interior or exterior, ensheathing or ferrule required to keep the limb so that fracture dressings cannot be removed. The interior and ensheathing callus will form by nature. (Billroth, p. 208).

In compound comminuted fractures no pains must be spared to remove particles of loose fragments. The wound should be thoroughly cleansed by antiseptics, as bichloride, 1-2000. If then, the fracture is properly coaptated and kept immobile, the bone will heal by first intention. When the dressing has to be changed or renewed, this can be done without disturbing the fracture in the least. After a practical use of this apparatus for over ten years with such success, I now present it to the medical profession.

---

THE memory of Chevreul, the illustrious chemist, has been commemorated in his native town of Aggess, in France, by the erection of a bronze statue of him.

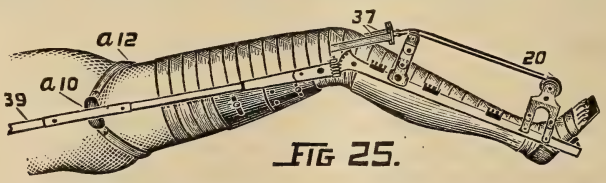

FIG 25.

**Ovariotomy in the Pregnant.***

Dr. Disrne–Livland, has collected from literature 135 cases of ovariotomy performed during pregnancy.

Mortality of the operation is 5.9 per cent. Pregnancy was interrupted by means of the operation in 22 per cent. The puncture of the cyst and artificial induction of labor are not advised, either as a means for relief or for cure. All cases should be operated upon as soon after the the diagnosis is made as possible. This will give best results for the mother. The 2nd, 3rd, and 4th, months are most favorable—*Schmidt's Jahrb.*, No. 9, 1883.

*Translated for THE MEDICAL AND SURGICAL REPORTER by Marie B. Werner, M. D.

# STUDY OF THE RELATION OF GENERAL DISEASE TO THE DEVELOPMENT OF CATARACT*

EDWARD JACKSON,† A. M., M. D.

The possible causes of cataract may be considered under three heads, namely: senile degeneration, disease of the eye itself, and general disease impairing the nutrition of the crystalline lens by some influence exerted through the blood or through the nervous system.

The influence of senile change is obviously indicated by the occurrence of cataract chiefly after middle life. That such an influence exists, and is powerful, probably no one questions; but the view that it is the sole cause, or anything more than a predisposing cause in a majority of cases, seems to be negatived by the clinical history of cataract. The changes of age, those which result from the lapse of time and the purely physiological use of an organ under physiological conditions must be, in the main, slowly and steadily progressive; at least, if they were more evident at some times than others, they would never become entirely stationary or in any case retrogressive.

The one fact, however, in the clinical history of so-called senile cataract that seems firmly established by the studies that have heretofore been made of it, is that in the majority of cases the condition is not steadily progressive, but is marked by periods of rapid increase and periods of little or no change, or even in certain conditions, by periods of diminution of opacity.

I well remember a case occurring some years ago in the service of Dr. Harlan at Wills Eye Hospital, where we were inclined to think from the appearance of the opacity that it was likely to be rapidly progressive; the patient received the opinion with perfect composure and apparent indifference, the cause of which became evident when she informed us that she had been told the same thing six years before, and that there had been no perceptible change in her vision during that interval.

In a classical case reported in the *Royal London Ophthalmic Hospital Reports*, 1866, Bowman had seen the patient eighteen years before, and had made a drawing of the opacity which substantially represented its appearance after this long interval.

In a large proportion of the cases of advanced cataract that come to us, the history as obtained from the patient shows one or more periods of a rapid increase of the cloud over the sight, with other periods in which there was little or no change. In my experience it is quite the exception to find that the difficulty has increased steadily and continuously after a period of months or years. From this observation the obvious deduction appears to be that although senility may be a predisposing cause, the efficient determining cause of cataract must be of quite a different character, at least for the great majority of cases.

Of the importance of local pathological conditions within the eye-ball, particularly those of the nutritive coat, the choroid, the importance of which has been strongly urged by Dr. S. D. Risley, I do not now propose to speak. Their importance is certainly very great, but it seems to me clear that general conditions of nutrition are also of importance in this connection. It may be claimed that general conditions act by their influence on the choroid. But even admitting this, such influence often does not become evident by any changes that can be detected in that membrane, but only by the resulting altered nutrition of the lens; and the changes in the choroid, though they may exist, being secondary to the generally departure from health, the practical thing to do is to fix our attention and address our remedies to that.

The literature of cataract as carefully reviewed by Dr. de Schweinitz shows a large number of attempts to connect the occurrence of lens opacity with particular general diseases, but with conclusions based upon very insufficient data. For instance, one writer reports a series of cases of cataract in which heart disease was present, and upon the frequency of such a concurrence attempts to establish a connection. So many are the factors to be considered that probably no statistics

*Read before the Phila. Co. Med. Soc.

†Professor of Diseases of the Eye in the Philadelphia Polyclinic; Surgeon to Wills eye Hospital.

of concurrence possible, up to the present time, or likely to be obtainable in the near future, would furnish a substantial basis for any valuable conclusion in this direction.

Again, very many reported cases, and this applies particularly to the striking ones that might be regarded as of great value, are vitiated by probable inaccuracy of diagnosis.

The difficulty of avoiding errors of this sort may be illustrated by a case reported by Dr. Ruschenberger, of this city, in the *American Journal of the Medical Sciences* for January, 1846. In this case, which was one of acute pneumonia, he noted that "a cataract formed in the right eye within thirty-six hours, and without any appearance of local inflammation. It was ashy white, and vision totally extinct." The case, however, proved fatal. At the autopsy it was discovered that "what was supposed to be a cataract proved an effusion of lymph within the margin of the pupil slightly adherent to the iris. This lymph formed a disk, covering the anterior face of the lens, which was transparent."

Indeed, so imperfect has been the observation of cases, and the sifting of evidence bearing upon this subject, that with regard to the share of particular diseases in the causation of cataract, it is only perhaps with reference to diabetes and ergotism that the testimony can be regarded as sufficient to establish a connection.

Of course, so many inconclusive attempts to establish such a connection between cataract and disease are of value as negative evidence that no such connection exists. They do not, however, militate against the view, that certain vices of general nutrition which may arise in many specific diseases are an important factor in the production of cataract.

Organic heart disease, gout, and arterial sclerosis, as distinct diseases, may have little connection with cataract, yet in their course there may arise the physical conditions which will in particular patients determine the opacification of the lens. To determine whether that is or is not the case will only be possible by the careful and prolonged study of individual cases, the opportunity for which is rarely accorded to the ophthalmic surgeon.

Several years ago, while in general practice, I had an opportunity of watching a case of mitral disease, during several months of cardiac insufficiency, along with serious gastric disturbances. During this period there was rather rapid impairment of vision through the development of lens opacity, presenting the ordinary clinical characters of cortical senile cataract. Finally, compensatory hypertrophy re-establishing the balance of the circulation, the digestive disorders were relieved and a better state of health was brought about. Vision slightly improved, and for two years the cataract remained quite stationary. After that I am informed her impairment of vision was very slightly progressive for several years. But, prior to her death, as her general condition became impaired, the cataract again grew rapidly worse.

Though cases of this kind may occur frequently, such a patient consulting one or more ophthalmic surgeons in the period of comparative health, they would be quite unable to establish any connection between the lens opacity and the general disease. Again, the medical practitioner who did not employ the ophthalmoscope, or who was not sufficiently familiar with its use to exclude changes in the choroid or vitreous from any share in the progressive impairment of vision, would be quite unable to give convincing evidence upon the subject.

It would seem that here, as in so many other cases, scientific knowledge is only to be advanced by the working together of the specialist and the general practitioner. It might be supposed that this could be accomplished in the general hospitals that have upon their staffs skilled ophthalmologists. But such a study to be of any considerable value must extend over a long period—many months or years; and hospital patients are proverbially inconstant, so that to follow them for the necessary length of time is generally quite impossible. The conditions of private practice, where the family physician remains the trusted medical adviser for years, are those most favorable to such a study, and under its conditions it ought to be more frequently undertaken.

This is especially the case, since the good of the patient urgently demands exact and skilful treatment in all cases of commencing senile cataract. If we are to-day able to do less than we desire to in-

fluence the general conditions, we have some positive knowledge and ability to cope with the local conditions which attend or cause the development of cataract, and the interest of the patient demands the application of our knowledge in every case. Nor is the consultation of the ophthalmologist only justified when a commencing cataract if feared. There is no condition leading to impairment of vision in the course of acute or chronic general disease in persons over fifty years of age that does not demand prompt and accurate diagnosis and appropriate modification of the management of the case.

In early life we do have failure of accommodation, and perhaps some other conditions leading temporarily to impaired vision during or after acute disease, which may go on to recovery without medical interference; but in persons past fifty years this does not occur; and, whether the impairment of vision be from cataract or from some other cause, there is equal need of a full understanding of the case.

Probably the mere calling of certain forms of cataract "senile" is partly responsible for their neglect. Cataract is not due to age in the sense that arsenical poisoning is due to arsenic. It ought to be clearly understood that cataract is senile in the same sense as the fibroid kidney, or arterial atheroma, and is quite as worthy of careful diagnosis and intelligent treatment. The interests of the patient demand his professional supervision; the benefit he may derive from it is as definite and unmistakable as in other diseases. And this supervision should include general as well as ocular conditions, and when it does we begin to accumulate data upon which the medical treatment of cataract will be a rational procedure.

What the general conditions are that specially favor the formation of cataract in the present condition of our ignorance it is scarcely worth while to speculate. Perhaps the most plausible hypothesis is the one urged by the late Dr. Isaac Hays, that the lens opacity is due to a deficiency of water. This was offered as the explanation of diabetic cataract, and that produced experimentally by injections of sugar and various salts beneath the skin of the lower animals. It is also favored by the evident shrinking of the lens when cataract is produced by feeding the animal with naphthalin and the subsequent clearing of such a lens when placed in water.

An hypothesis more nearly in accord with the present views of general pathology, and one probably worth bearing in mind, would be that of the formation and circulation within the body of substances which, reaching the lens by the normal course of the nutritive fluids, act upon it unfavorably.

Briefly, the points which I desire to emphasize by this paper are:

In general, senile change does not produce cataract, but predisposes to it.

The efficient determining causes of cataract are both ocular and general.

The general causes of cataract are not particular diseases as diseases are usually described and classified, so much as physical conditions liable to arise in the course of various diseases.

The nature, prevention, and removal of these general conditions that underlie the development of cataract offer promising fields for scientific study.

The professional supervision necessary for the making of such a study is demanded by the interests of the individual patient.

Speaking more specifically, the study of a cataract case should include the careful testing of vision at regular intervals.

The further examination of the eye to determine in how far impairment of vision is due to cataract, and in how far it is due to other causes.

The careful watching of the patient for other symptoms of impaired general health, especially for faults in the circulation, digestion, and assimilative metabolism.

Particularly at the first appearance of cataract, and at seasons of its rapid increase, would such a study of the case be of importance.

# THE NECESSITY FOR THE EARLY RECOGNITION AND TREATMENT OF SUPPURATIVE DISEASES OF THE TYMPANUM, AND THEIR RELATION TO CEREBRAL COMPLICATIONS.*

S. MacCUEN SMITH, M. D., PHILADELPHIA.

In bringing the subject of this paper before you this evening it is with the hope that one of the many urgent subjects of otology may be so clearly presented, in connection with the discussion which follows, as to deeply impress the busy practitioner with the importance of the early recognition and treatment of aural diseases in general.

We think it is an admitted fact that of all human ailments diseases of the ear have been the most neglected.

From the early days of medicine to the present time aural diseases have largely fallen into the hands of cunning quacks, who, through their hocus-pocus methods, have mystified the always gullible public. In fact, the science of otology has been reduced almost to the primitive teachings of the dark ages, when it was declared by the expounders of ancient wisdom that urine of the male and female, respectively, would cure ear diseases in the opposite sex, and that inflammatory conditions of the ear might be alleviated by one of their pharmaceutical specialities, composed of "the delicate admixture of the excrement of pigeons and the ashes of horses' dung, to which might be added finely pulverized black pepper."

Judging from the statements of patients, there still exists among some of the profession a belief, which is largely shared by the laity, that something mysterious or magical surrounds the diseases of the ear and their treatment. With this opinion prevalent we cannot express surprise at many of the unfortunate sufferers volunteering the information that they had been advised to "*Let well enough alone;*" "*it is bad to meddle with the ears;*" "*do not tamper;*" "*never heal a running ear or it will go to the brain and kill you.*"

It is also of daily occurrence to find that the syringe has been roughly used to throw a stream of water on an *exposed drumhead*, or that the popular but uncleanly habit has been suggested and followed of dropping greasy and other fungus-generating fluids into the ears.

This evident lack of information is, of course, due to the fact that in former years in many of our medical colleges otology had received only the minimum consideration, while in some institutions this most important branch of medicine had not even been mentioned in their curriculum. So long as students are not required to pass an examination on aural or other diseases it will be fonnd that their knowledge of the same is almost *nil.*

It is indeed gratifying to be able to note the increasing interest and demand for special instruction on the ear and its diseases. To the recent graduate in medicine a knowledge of this branch now becomes imperative, as many of the State Examining Boards require applicants to pass an examination on otology.

From a medico-legal standpoint the subject is of the utmost importance, for certainly the time is not far distant when it will be regarded as illegal for one to so neglect a suppurative disease of the tympanum (either acute or chronic) that fatal cerebral complications result therefrom. Brain abscess and meningitis, as the result of ear diseases, are in the great majority of cases preventable. It, therefore, becomes the imperative duty of every practitioner of medicine to properly diagnose and treat such cases. This duty is especially important to the physician of general practice, inasmuch as he is usually the first to be consulted, and his direction and care of the patient at that critical time is often of vital importance.

In order to give an idea of the importance of ear diseases in their relation to general medicine and the responsibility and duty of the profession at large to the public, it will be interesting to note that it has been estimated by various authors that from 43 to 76 per cent. of all brain abscesses arise, either directly or indirectly, from suppurative disease of the middle ear. To this I should like to add that the same figures would probably not

* Read before Philadelphia County Medical Society, 1893.

exaggerate the large number of cases of meningitis and pyæmia which, on account of their doubtful etiology, are termed and accepted as "obscure." Barker, as quoted by Keen and White, estimates that not far from two thousand deaths, caused by diseases of the ear, annually occur in Great Britain, with a population of little more than one-half that of the United States.

These are, indeed, impressive figures, and are especially deserving of serious consideration, from the fact that there are annually dying in the United States probably four thousand of her inhabitants from brain abscess, the direct cause of which is some pathological change in the ear. Our belief is that should these cases receive early recognition and proper care the mortality, at least, would be greatly reduced and the fatal complications in most cases be prevented.

As a rule, an acute inflammation of the tympanum is painful in the extreme; and yet it must not be forgotten that we will at times find a case where the membrana tympani will rupture with the consequent flow of discharge, which will be the first and only symptom to attract the patient's attention. These cases, however, yield promptly to treatment, unless dependent upon some enfeebled condition of the constitution. On account of the symptoms not being urgent they attract but little or no attention, and, therefore, are allowed to form a good foundation for a chronic purulent suppuration with all its possible serious consequences.

An acute suppurative otitis media is usually the result of the acute non-suppurative variety (commonly known as earache) the symptoms of which briefly are, a sense of fulness in the head accompanied by more or less tinnitus and so-called "neuralgia." In my experience these symptoms precede the real pain several hours, or in some cases it may be several days. The pain, which is very severe, generally occurs at night, and is referred to the ear and along the Eustachian tube. In most cases considerable fever is present, and marked impairment of hearing. As the pus accumulates the bulging outward of the membrana tympani correspondingly increases, and the tension resulting therefrom intensifies the pain almost beyond endurance. It is in this state or stage of the disease that immediate relief is so earnestly demanded for the present and future welfare of the unfortunate sufferer.

Should the patient have the good fortune to have the distended drum promptly punctured in order to promote the free escape of pus, and this followed by gentle inflation through the Eustachian tube, together with general antiseptic care and the use of leeches, the hearing will in most instances be quickly recovered, the discharge will cease, and all the functions of the organ will soon be re-established.

If, however, the pus is not promptly evacuated the patient is in imminent danger of one or more of the serious consequences that follow such neglect. Should the drum be so thickened and bound down by adhesions as to enable it to resist the pressure, as is sometimes the case, the pus will then, by one of the several means of communication, produce a septic inflammation of the brain or its coverings, which usually has the result of a prompt fatal issue. Or the pus may communicate with the mastoid antrum, thence to the mastoid cells, thereby subjecting the patient to all the serious, and ofttimes fatal, complications of a such a condition.

Fortunately, however, these complications are not of frequent occurrence from acute suppurative otitis media, for, in neglected cases Nature has wisely provided a drum that will usually rupture of its own accord when the pressure for accumulated pus reaches the dangerous point; or, as it occasionally does, the pus finds an exit through the Eustachian tube into the throat. This is particularly the case in children, because the calibre of the tube is proportionately much larger in early life.

Brain and mastoid complication arising from a suppurative inflammation of the ear are in nearly all cases a result of the chronic variety, although I have seen several fatal cases from the acute suppurative form. There is usually a history of chronic discharge, frequently even extending over many years. At times the "running" will cease, and the physician and patient (if he be under treatment) will congratulate themselves on the apparent success of their therapeutics, when quite unexpectedly the patient again applies for relief from a severe pain in the ear, caused either by exposure to cold or

wet, or it may be from some trivial accident, such as a slight blow upon the ear or head.

Any patient suffering from a suppurative otitis media, be it of the continued or recurrent form, is in constant danger (either from exposure to cold or traumatism) of a fatal termination. "Many apparently unaccountable cases of fatal coma are explained in this way; an old cerebral abscess, which has already lasted weeks or months without giving rise to any definite symptoms, suddenly giving away and bursting into the ventricular or subarachnoid space." It is, therefore, a safe and wise rule, as well as duteous teaching, to regard every person with a discharging ear as being in such a condition that serious, or even fatal, complications may arise on the slightest provocation.

Recent bacteriological investigations demonstrate beyond question that the quantity and especially the quality of the discharge is an all-important factor in considering the prognosis of individual cases. The popular impression is that so long as a discharge is copious and devoid of fetor it is harmless, and of such little moment as to demand treatment only from a point of tidiness or inconvenience. This belief, notwithstanding its almost universal acceptance, is misleading and is calculated to cause in the future as it has done in the past, much misfortune.

It is entirely true that in a freely "running ear" we have present the best possible condition to prevent brain complications, and yet we must not lose sight of the fact that a decrease in the discharge, and especially if it should stop suddenly, must be viewed with some degree of alarm, inasmuch as this sudden or more gradual decrease in the flow is frequently caused by inspissated masses of mucus and pus collecting behind a wall of dried and hardened epithelium intermixed with pus, and entirely occluding the opening in the ruptured drum, consequently preventing the escape of discharge which continues to form until the accumulation causes much pressure, and the brain or mastoid complication may be the result.

Generally speaking, a discharge of pus without fetor is considered harmless, and, therefore, in most cases receives little or no notice, unless for cosmetic purposes. Although the number of observations on the pathology of the putrefactive changes within the ear have been limited and confined to the researches of only a few investigators, sufficient information is at present made known from the recent discoveries in micro-biology to establish the fact that non-fetid pus from the ear contains large quantities of pathogenic cocci, and is, therefore, highly infectious and dangerous to life. In fetid pus it is true that cocci are also found, but they are of the diplococci variety, and the bacilli which are also present largely predominate.

Barker, who has given this subject much thought and study, writes as follows: "From his inoculations of animals with cultivations and pus emulsions Rohrer came to the conclusion that the various forms of bacilli found in the fetid secretions of the ear were not pathogenic but simply saprophytic, the animals inoculated with the bacilli either in the tympanic cavity, the auricular veins, or the peritoneum, being alive and well at the end of some months, little or no action having taken place locally. But of the pathogenic nature of the cocci there could be no doubt, from his experiments on animals typical septic diseases of various kinds being produced without fail. These observations appear to me to possess a special interest as regards the question of fetor from the ear. It has been commonly taught hitherto that a bad smell from the ear is an important factor in the prognosis of aural inflammations. My own observations, however, for a long time past have led me to question this conclusion very seriously, and to hold and teach that some of the most dangerous sequelæ of otitis media may be met with where the secretions from the tympanum are either nearly or quite odorless."

"If this be true, and I fully believe it to be so, the explanation is found in Rohrer's observations regarding the pathological cocci found alone in the non-fetid discharges, and the preponderance of merely saprophytic bacilli in the fetid. We must not, therefore, think the less seriously of a discharge from the ear because it is odorless, but must endeavor to get rid of its exciting cause just as strenuously as if it were most offensive. This is only what we might expect from an experience of ordinary suppurating wounded surfaces in other parts, which in many cases give rise to serious or fatal

septic complications without giving off any fetor."

Caries and necrosis are a frequent and serious complication of suppurative otitis, and are produced by ulceration of the inflamed mucous membrane of the tympanum, by extending to the deeper layers of that membrane (which act as the periosteum on the inside of the osseous cavities) and finally attacking the bone itself.

Politzer describes the process as "an infiltration of round cells into and around the fibrous tissue which penetrates the substance of the bone as offshoots from the mucous membrane. These round cells may undergo three transformations: they may break up and be absorbed, they may be converted into connective tissue in which depositions of lime may take place, and we then have a thickening of the bone, or they may, by degeneration and erosion, produce an ulcerative osteitis. This ulceration may be due to constitutional taint, or to retention and decomposition of secretion, or to the catarrhal ulceration and wasting of the mucous membrane."

As the carotid canal (through which passes the carotid artery) forms the anterior wall of the tympanic cavity, and the jugular fossa (in which lies the bulb of the jugular vein) constitutes the floor of the tympanum, it will be readily seen why dangerous and even fatal hemorrhage may occur as the result of caries and necrosis of the middle ear. The bony walls of the tympanum are always thin, and in some cases the roof is entirely absent. The middle and back part of the temporo-sphenoidal lobe and the outer and front part of the lateral lobe of the cerebellum are in direct contact with the middle ear. Knowing this intimate relation of the tympanic cavity to the brain to exist, it does seem surprising that many more fatal results from inflammatory diseases of the temporal bone are not recorded.

As the skin of the external auditory canal (being somewhat modified) is continuous with and forms the outer layer of the membrana tympani, suppurative otitis media may be set up from without as well as by infectious matter reaching the tympanum through the Eustachian tube, the mucous membrane of which is continuous with that of the throat and forms the inner layer of the drum. And, as many of the mastoid cells lie below the level of their opening into the middle ear, and the floor of the tympanum is in part below the orifice of the Eustachian tube, it will be seen how a suppurative disease of the tympanic cavity, or even the mastoid cells, may continue in a chronic state for months or years.

In suppurative otitis media brain abscess may be induced by direct continuity of structure, or the infectious matter may be communicated to the dura mater, causing subcranial abscess or diffuse meningitis, or to the bloodvessels in the diploe giving rise to osteo-phlebitis, thrombosis of the lateral sinus, or pyæmia. Or, as is the case in suppurative otitis externa, likewise in neglected otitis media, the pyogenic germs may find their way between the opening formed by the nonunion of the vaginal and mastoid processes, thus producing a superficial mastoid abscess.

Through carious involvement of the malleus and incus there is frequently a direct communication between the tympanum and the mastoid antrum and cells, this being the usual way in which pus invades these cavities and forms a true or deep mastoid abscess.

There are many other routes along which the infection may travel; it may extend through the hiatus fallopii or the aqueductus vestibuli, or down the internal auditory meatus, or it may extend along some of the numerous small veins which run between the internal and middle ear on the one hand, and the dura and pia mater on the other.

I will now briefly relate one interesting case of mastoid disease following an acute suppurative otitis media.

On March 26th, 1892, I was called to see Mrs. L. B. and found she had been suffering from a severe pain in the left ear and head for two weeks. On inspection nothing could be seen that would suggest a forming abscess of the middle ear, and as the pain in the head was so general it quite deceived the attending physician. On examination through the meatus we found a greatly inflamed drum and bulging of Shrapnell's membrane. We immediately opened the drum, which allowed a free escape of pus and greatly relieved the patient's pain. This was followed by leeches in front and blisters behind the ear; after which hot poul-

tices were applied to promote suppuration. From this line of treatment entire relief was obtained for five weeks (but the ear continued to discharge), when pain was complained of over the mastoid; in fact, it involved the entire left side of the head.

The usual active measures were at once adopted to relieve pain, but the brief cessation of suffering was only while under the influence of drugs. (It is well to state that neither the mastoid nor any part of the head showed any evidence of either redness or swelling). Three weeks later she expressed her willingness to submit to an operation, and, with the kind assistance of Dr. J. M. Barton, I opened the mastoid cells, evacuated the pus, and found, by using the syringe, that the opening in the mastoid communicated with the external auditory canal. This established perfect drainage, which relieved the patient of all pain and discharge, but the hearing was found to be destroyed.

In August we removed the drum and ossicles, which resulted in the almost immediate restoration of her hearing, which remains normal at this writing.

As all inflammatory conditions and abscesses of the brain are most serious, and especially so when dependent upon disease of the temporal bone, it, therefore, becomes our imperative duty to make every effort to prevent these unfortunate complications, rather than to hope for their relief after having once developed.

It is not the object of this paper to enter into the subject of treatment from a general surgical point of view, but simply to offer such suggestions as are thought to be in a measure preventive, for it must now be admitted that many of the serious complications arising from diseases of the ear have much to commend the probability of their being preventable. As already shown, the majority of brain and mastoid diseases are due to a suppurative disease of the tympanum, and are usually the result of the chronic from of discharge.

Most cases when applying for treatment give the history of a "running ear" extending over months or years, and that it has resisted treatment in the hands of many competent physicians. In cases of chronic discharge from the ear that do not yielded to due and proper care it is now our rule to advise the removal of the drum and one or more ossicles.

By this surgical procedure we establish a free drainage and make an opening into the tympanum sufficiently large to admit of the site of the disease being properly treated by antiseptic washes and applications, and, if this interference be established before brain or mastoid complications have set in, these developments will almost surely have been prevented; besides, the discharge in nearly all cases will cease, and the hearing in the majority of patients greatly improve, while in others it becomes quite normal.

Or, if you have a case presenting symptoms of cerebral irritation or abscess where there is a chronic "running ear," and it does not yield promptly to the above measures in conjunction with leeches to the mastoid, etc., it may be due to pus confined in the mastoid antrum, and no time should be lost in making an incision over the mastoid and trephining the same half an inch behind and above the centre of the external meatus. Within the past year I have seen five cases relieved by this method of treatment. In suspected mastoid disease an incision down to the bone is often delayed too long, and, perhaps, is never done too soon.

---

**Destruction of Microbes by Infusoria.**

D. Harvey Atfield (*Brit. Med. Journ.*), a student in the Hygienic Institute of the University of Munich, recently carried out a number of experiments at the suggestion of Dr. Emmerich for the purpose of determining whether microbes of polluted river water are destroyed by infusoria. The experiment shows very clearly that the low forms of animal life which abound in river water are exceedingly active in the destruction of bacteria, and hence of service in the purification of water. In one instance, water which contained 3,000,000 bacteria per cubic centimeter ($\frac{1}{4}$ dram) was found to contain at the end of ten days after infusoria was introduced only 13,000 bacteria, a proportionate decrease of 200 to one. In another case the decrease was 500 to one. In another case of water placed under the same conditions, without the infusoria, the number of bacteria increased from 700 per cubic centimeter to 121,500.

# SOCIETY REPORTS.

## SECTION ON ORTHOPÆDIC SURGERY OF THE COLLEGE OF PHYSICIANS OF PHILADELPHIA.

*Meeting November 17, 1893.*

Dr. J. B. Deaver exhibited a patient showing the result of subcutaneous osteotomy of the neck of the metatarsal bone for hallux valgus and gave the history of the case.

DISCUSSION.

Dr. H. Augustus Wilson opened the discussion by exhibiting a cast of a similar case in which there was extreme hallux valgus of the right foot, the metatarsal bone being decidedly pushed from the normal position underneath the second biceps. It was originally the intention to amputate the toe. A bursa was present on the right foot, and this was found to be a segment of the joint, which the patient had opened thinking it a corn, or a bunion. The pain was excessive.

Dr. T. G. Morton: The cases of this form of toe distortion which have come under my care have generally been accompanied by serious joint disease, so much so, that excision of a wedge including the entire articulation was required. I have never performed osteotomy which is at once so simple and efficacious for the moderate forms of the malady. I believe that in the great majority of cases that the operation as performed on the patient before us, which has been so eminently satisfactory is all that generally would be required.

Dr. G. G. Davis: Dr. Deaver speaks of the shape of the shoe as being the cause of the deformity, but I cannot fully agree with him. In some of these cases there is a marked rheumatic element. I do not think it is *always* produced by pressure. I cannot believe that an ill-fitting shoe alone, in all cases, produces it. There is often some rheumatic condition in the neighborhood of the joint.

Dr. Deaver: In answer to Dr. Morton, I confess I have not done osteotomy on so pronounced a case as the one referred to, but my deductions from the literature on the subject and from my experience with the operation, are that it would fulfil the indications in the case referred to. I have no doubt of its superiority over amputation and that we can promise the patient a good result. We all know there is a great objection to amputating the great toe, therefore, the more conservative operation is the better one if it can be done. We also need to note the absence of evidence of adhesions in the joint after the osteotomy.

In my own case, the condition was the result of a frost bite, but I believe with Dr. Davis, that a rheumatic element is to be considered. In any case where the deformity exists, the sooner it is corrected the better. I do not believe in any of the ordinary appliances; all of them are unsatisfactory; they make the shoe large and unwieldy and simply add to the existing deformity. The operation is not attended with any risk. We all have operated upon cases of knock-knee where there was greater deformity and made good corrections.

Dr. Wilson's illustration of the prominent head of the metatarsal bone being mistaken for a bunion only shows how careful the general practitioner should be, and in any case of doubt refer it to an authority.

---

Dr. T. G. Morton brought before the Society a very unusual instance of

GENERAL BODILY DEFORMITY, WITH ANKYLOSIS OF THE SPINE, UPPER AND LOWER EXTREMITIES, ETC.,

in which he asked the attention of the members as to the possibility of any operation affording improvement, and gave the following brief history of the patient:

"In July last I received a note from Dr. Wright, of Gipson, Alabama, asking for permission to send to the Orthopædic Hospital a case of deformity in an adult which was thought could be improved. As it was impossible to obtain an exact description of the case, the patient was allowed to come North, and accordingly he started on his journey; first riding fifteen miles in an ox-team, then without change to this city. He was so deformed that he had no use of his lower extremities and was confined in a sitting posture

in a rude, home-made chair which he constantly occupied. The following notes of the case were taken by Dr. Walker, of the Hospital.

*Family History:* Amos C. G., aged 32, of Gipson, Alabama. Parents living. Father æt. 55, has had rheumatism from boyhood. Mother æt. 65 years, suffers almost continually with neuralgia. Two brothers living, both have had rheumatism.

*Previous History:* Patient was always well until ten years old, when he had an attack of rheumatism commencing in the right hip-joint; the knee-joint of the same limb was involved, then the ankle, and later the joints of the left lower extremity, spinal column, and finally both shoulders, elbows, wrists, and to a less degree the fingers and toes. The extension as above described occupied a period of three years, during which time he suffered intensely and could be moved only with great difficulty. Joints were hot and swollen—fever moderate. His limbs were in one position during all this time, though not then ankylosed; he says that he could move but the effort caused intense pain.

At the end of three years, 1874, the pain became less acute, gradually lessening until the year 1885, at which time he says no rheumatic pain remained, but the joints were stiff as at the present time.

During the years of his first attack (from 1871 to 1874) he spent much of his time in an ordinary chair, leaning upon the arm of the chair which was placed along side of him, this position evidently accounting for the lateral curvature and some of the deformity of the trunk now seen. In 1874 he had a chair made of the same pattern as the one now in use, but for a time had to support the greater part of his entire weight by the arm pieces (two pins, one beneath each shoulder joint) because of the pain in the hips and spine if those joints were subjected to any strain. This would explain deformity seen here (elevation of shoulders).

This chair was made with a cross piece passing beneath the knees for support. Femora found curved at this position. In 1886 had another attack of rheumatism affecting principally the shoulder joints and those of the neck. Several joints have been affected at different times since then.

*Present state:*—Head normal in size and shape; wears $7\frac{1}{8}$ hat.

Trunk undersized and mis-shapen, antero-posterior and lateral curvature of spine which is perfectly rigid.

Legs flexed on thighs, almost in contact; thighs on pelvis and in contact with abdomen; and pelvis upon the thorax; the anterior superior spinous processes of the ilia being almost in contact with the lower ribs.

All the joints of the lower extremities are firmly ankylosed with the exception of the phalanges.

The right arm can be bent at an angle of 45° with the shoulder. The right elbow is fairly ankylosed, no pronation or supination. The left arm can be brought to a right angle with the trunk at the shoulder; left elbow firmly ankylosed about at a right angle; pronation and supination normal; wrist and phalangeal joints normal.

Weight, $52\frac{1}{2}$ pounds; Measurements: Height from top of head to lowest part of body as he sits in chair, 22 inches; right calf, $5\frac{5}{8}$ inches; left calf, $5\frac{5}{8}$ inches; right arm, $5\frac{3}{4}$ inches; left arm, $4\frac{3}{4}$ inches; right fore-arm, 6 inches; left fore-arm, $4\frac{3}{4}$ inches. Appetite fair; digestion well performed; tendency to constipation. Heart, liver and lungs normal; urine highly acid; sp. gr. 1030; excess of urates; no abnormal constituents.

I shall be glad for the members of the society to examine this patient and then to give their views as to the possibility of any good being attained by operative interference. From a careful study of this case I feel that little if any improvement can be secured by any operative treatment on account of the inability of the man to use his arms to any extent, the ankylosis of the spine which precludes any movement of the body, and finally the excessive atrophy of the lower extremities, which, even if brought out straight, would not support the weight of the body. Probably the best that can be done will be to give him a suitable apparatus to support his arms as an attachment to a proper spinal brace.

DISCUSSION.

Dr. H. Augustus Wilson: Dr. Morton speaks of the possibility of reproducing one of his successful experiences, and, after bringing the legs down, of adjusting artificial limbs. It seems to me that osteotomy in this case would be an unwarrantable procedure, even if the legs were brought into good position, the curvature of the spine, the rigid pelvis, and the position of the head to one side,

would make the result one of disappointment even if osteotomy in itself were successful. I am rather of the opinion that a wheeled chair would be the best thing for him. He has probably sufficient motion of the shoulders and hand to enable him to move a chair about. Something similar to the chair he now uses, with wheels added, would be a wise arrangement so that the patient could have more freedom of motion. The outdoor life thus induced, as well as the movements of the arms in propelling the chair, would be decidedly beneficial. In the sitting posture he could adopt some occupation by means of a movable shelf attached to the chair, and thus be relieved of the strain of idleness.

Dr. Frank Woobury: Rheumatism in children is not a very rare affection, but this patient certainly presents conditions rarely met with, and is a most interesting case. Probably it would be more correct to regard it, not as a case of rheumatism but as an illustration of arthritis deformans in an advanced stage of the disease. As the patient is now thirty-two years of age, and has been suffering for twenty years, or more, of course the long course of the disease would be against any marked benefit arising from an operation, especially as there is only infantile development of the lower extremities. Regarding it as chronic arthritis, we recall the fact that in these cases, cod-liver oil, massage, gymnastics, hot applications, and electricity to improve the muscular tissues are able to accomplish much good. By directing such treatment, especially to the upper extremities, he might gain sufficient range of motion to feed himself or to propel himself in a wheel chair and get more comfort out of life. It must, of course, be determined, surgically, whether there are any fibrous adhesions in the elbow or shoulder joints which could be broken up by forcible flexion, but as regards anything in the way of operation, I think that more radical measures might safely be postponed until the limit of improvement by the treatment just outlined, has been attained. Certainly a six months' course of medicine would put him in better condition for operation, even if it were determined that such proceedings are necessary.

Dr. G. G. Davis: What struck me in looking at this case is the fact that the patient appears to be in a moderately healthy condition and would very likely stand operative procedures well. It would be a great gain if he could be made to stand upright. Failure might arise, of course, from sepsis, etc., but the advantages from straightening the extremities would be so great, and his health appears to be so good, and the dangers from osteotomy so small, that I think some operation might be undertaken. His condition could hardly be worse and he might possibly be benefitted; to what extent, I am unable to say, but it might be worth the attempt.

Dr. H. R. Wharton: I would like to ask Dr. Morton if he would have any hesitation in giving this man an anesthetic. It seems to me that I should have some anxiety in doing so. So far as osteotomy is concerned, certain corrections might be made but I do not really see how the condition of the patient could be much improved. I do not think much motion could be obtained. I am inclined to think that the judicious course would be to make him comfortable by a mechanical contrivance. I have had considerable experience with osteotomies, and the wounds usually do well, but in some conditions of the tissues, sloughing occurs, and the patient is very sick from the operation itself. I should be rather inclined not to operate.

Dr. DeForest Willard: In my judgment it would be doubtful whether the patient would be able to manage artificial limbs even if his legs were put into good position. Necessarily the artificial legs would be heavy, and I doubt whether he would be able to balance himself since his back and neck are so rigid. Osteotomy is as operation, simple in itself and not attended with any special danger.

I know of a case in this city, not quite so much deformed as this one, but having its origin in rheumatoid arthritis. It did not occur so early in life but otherwise it is quite similar. Nothing could be done for the patient. Another case is that of a man so much deformed that he has lain in bed for twenty years. The disease in him is aroused by any attempt at motion of the joints.

Dr. J. B. Deaver: I should hesitate to change the topography of the blood vessels on account of a cardiac diathesis. Several osteotomies would have to be done, and it is a question in my mind whether any great gain would be secured. The bones

are particularly small and I question whether they would be able to endure any weight even if they were straightened.

Dr. T. G. Morton: In again referring to the question of anesthesia, I would like to ask if any of the gentlemen would fear to administer ether in such a marked case of spinal curvature; especially in so serious a case. The only case of sudden death, under ether, that I ever witnessed was in a patient at the Pennsylvania Hospital; within thirty minutes after operation the patient died from œdema of the lungs very suddenly. My own feeling is that there would be a great risk in this case and that the suggestion of a wheeled chair would be the best plan to follow.

---

RESECTION OF A RIB FOR EMPYEMA FOLLOWED BY LATERAL CURVATURE OF THE SPINE.

Dr. G. G. Davis exhibited a boy in whom two ribs had been resected and there was a resultant lateral curvature. He showed an apparatus which had been adjusted for the purpose of reducing the projection arising therefrom. The jacket was adjusted so that it made pressure on the pelvis, in the axillary fold, and counter-pressure on the opposite side by a pad.

DISCUSSION.

Dr. DeForest Willard: I should like to ask Dr. Davis whether I understood him to say that the deformity would probably grow worse as time goes on? My experience is that such deformities tend to improvement. I had occasion a few weeks ago to examine a case upon which I operated in 1872 for empyema, a girl then five years of age. Suppuration continued for six months and there was great deformity at the time; yet the patient has become absolutely straight and I had difficulty in determining upon which side the operation had been performed. In a number of other cases, the same result has been obtained and the improvement has been very marked under exercise and expansion of the lungs, which probably is the most important element.

In regard to the use of apparatus I have to say that I have never seen the deformity following empyema benefitted by any form of appliance. I rather look upon it as injurious by interfering with expansion of the lungs. I have always used some form of exercise with marked benefit.

Dr. H. Augustus Wilson: I would like to say that it appears to me that this case has reached the stage in which there are present all the conditions of idiopathic lateral curvature and marked rotation with the usual distortion of the thorax. It is a question whether apparatus does not tend to still further produce muscular atrophy and whether the chest will not decrease in size, the lateral curvature and rotation becoming more pronounced. The question is not settled in my mind whether most of the muscular atrophy is produced by scoliosis or by apparatus.

This particular apparatus has, in my judgment, one serious objection; the straps passing over the shoulders. The shoulders are brought into line by simple downward pressure even when there is a crutch resting upon the hips. Mothers will loosen the straps around the waist to give the child more comfort and the apparatus is therefore sure to drag still further upon the shoulder straps. The shoulder straps prevent a displacement of the apparatus, even when the lower bands are loose, and therefore they should be dispensed with. It is my experience that apparatus too often only conceals the deformity beneath but does very little in the way of correction.

Dr. T. S. K. Morton: I do not think I have had a case which improved under apparatus. I have obtained good results from the application of head extension at night with suspension at times during the day.

In regard to the use of a bicycle, of which Dr. Taylor speaks, it is a question, in my mind, whether this is wise, as we are already noticing in literature reference to a condition of kyphosis to which this kind of exercise gives rise.

Dr. J. B. Deaver: My experience fully accords with Dr. Wilson's. I have operated upon a large number of cases, many of them tuberculous; others resulting from pleurisy.

Relative to the lateral curvature which follows, I would say that most cases recover. I advise against appliance under the circumstance; I believe it to be a serious matter to interfere with chest expansion. Ordinary appliances are misleading, and, to my mind, do harm, often resulting in paraplegia. If support is required, my plan is to use plaster of Paris bandage the length of the spine, and at the end of a month I replace it by another

and the patient is thus straightened every time the bandage is altered. Those of us who are familiar with Dr. Adams' dissertations, know that he lays great stress upon this point, unless there is actual disease of the vertebral column.

Dr. G. G. Davis: The deformity in the case shown to-night has been more marked lately than it was a few weeks ago. I do not think that it will increase as time goes on, after sound healing has taken place and the lung begins to expand, but I am of the opinion that an apparatus for the resultant curvature is of marked benefit in the treatment for the condition as now present.

Some of the remarks made to-night apply to cases of pure lateral curvature and not to such a condition as that of the case exhibited. Dr. Deaver refers to paraplegia following the use of appartus. To this I would say that perhaps paraplegia may follow lateral curvature but I have never seen it as such a result.

As to the question of the use of a plaster jacket or brace, that is a matter of opinion: I do not think that this question has been definitely settled yet. When we find such men as Bradford, of Boston, and others, describing them one cannot regard apparatus as being always out of place.

In regard to this special case I do not see that healing would be delayed by an appliance. There is a projection on one side which is quite marked. I can see how expansion would be hindered by having the chest encircled by bandages, but in this jacket there is no constriction of the chest. It is the pelvis which is embraced and pressure is made over the projecting side and not the constricted one.

Dr. Wilson's suggestion in regard to the shoulder straps is a good and practical one, and I will watch the case to see that displacement does not occur. I would not, by any means, urge the continual use of such apparatus, but in the early period of recovery where the sinus has not healed, or just healed, I think it is good treatment, as without it, I think, in a comparatively short space of time, the deformity becomes more marked. I do not believe in substituting for exercise any mechanical appliance because I think nothing can take its place. Where an apparatus is supported from the hips, and there is no pressure made on the contracted chest, and the apparatus is capable of removal, if so desired, for exercise, I do not think it would at all hinder the recovery of a case.

---

Dr. W. J. Hearn reported a case of

SUPPURATION OF KNEE-JOINT

that he operated upon by free incision and washed out with 1-2000 bichloride of mercury solution. The patient made a rapid and complete recovery, ultimately obtaining full usefulness of the joint. Dr. Hearn advocated early and free incision for exploratory purposes because it enabled the surgeon to effectually evacuate the contents of such an abscess—and prevent its rapid destruction of the joint.

DISCUSSION.

Dr. Deaver: This particular case is interesting for the reason that last winter I saw, with Dr. Lloyd, a case of middle ear disease in which there was pronounced sepsis. I opened the abscess and removed pus; this Dr. Abbott examined for micrococci but without finding bacilli. I should rather take exception to Dr. Hearn's remarks that he thinks this treatment wise in all cases. I scarcely think that in all cases it would give good results.

Dr. T. S. K. Morton: I hardly agree with Dr. Hearn in advocating the use of strong a solution as 1-2000 bichloride of mercury. My experience is, in using antiseptics in joints, that they are a source of danger; that it is not possible to use such a strong solution without producing lesions. Iodoform appears to me to be the best antiseptic to use; in fact I do not use bichloride for washing out joints, as I find simple boiled water to be quite effective and without danger of doing harm. In using strong antiseptics there is a possibility of producing synovitis.

Dr. R. B. Cruice: In May 1892, I saw a case of a girl age three years, who had a suppurative knee-joint. She had been taken to the University and to the Children's Hospitals and had been told that nothing could be done except to amputate the limb. I opened the joint, passed a probe through to the opposite side and then injected the joint with peroxide of hydrogen, twice a day. At the end of thirty days the wound closed and I applied a splint. I did not see the case again until September, when the child was running about and appeared perfectly healthy. There was perfect motion in the joint.

# THE MEDICAL AND SURGICAL REPORTER

ISSUED EVERY SATURDAY

ADDRESS

Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D., Editor.

RODERIC C. PENFIELD, Publisher.

147-49-51 North Tenth Street, PHILADELPHIA.

**TERMS**:—Five Dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

**REMITTANCES** should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

**NOTICE TO CONTRIBUTORS**:—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, DECEMBER 16, 1893.

## EDITORIAL.

### IDENTITY OF THE STREPTOCOCCUS PYOGENES AND THE STREPTOCOCCUS ERYSIPELATIS.

Knorr (*Berliner klin. Wochenschrift,* 1893, p. 698) has reported the results of a comparative study of these two streptococci. The streptococcus pyogenes was isolated from the pus from an abscess which resulted from a slight injury to the great toe of a man of about forty years. The suppuration was accompanied by intermittent fever, high temperature and rigors. Later an abscess developed beneath the skin of the right thigh. From the pus from this abscess a pure culture of a streptococcus was obtained. It grew in long chains and was pathogenic for mice. Other pyæmic abscesses developed.

Four weeks after the attack of illness a severe rigor occurred with fever and the appearance of a typical erysipelatous eruption about a bed sore over the sacrum. Two days later isolated areas of erysipelatous nature were observed. From these pure cultures of a streptococcus were obtained. Cultures made from the blood did not develop. The two streptococci, one from the primary abscess, the other from the erysipelatous inflammation were identical in their morphology, cultural characters and in their pathogenic properties. The author believes, therefore, that this case demonstrates, more clearly than has heretofore been done, the identity of these two streptococci.

The fact has been known for a long time, that the difference between these two streptococci was very slight, as the description of one will apply to the other save perhaps, in the pathogenic properties. Bacteriologists have not been agreed as to the identity of these two important organisms. The results of a few other investigators concerning their identity are interesting. Prudden (*The Amer. Jour. of the Med. Sci*, 1889, p. 229) compared very carefully the *streptococcus pyogenes* and *streptococcus erysipelatis*, but found that there was not a single constant feature of difference between them that could be detected by cultural characters (parallel cultures), or by inoculations into the smaller animals. Fraenkel (*Centrablatt f. Bakteriologie u. Parasitenk*, 1889, Bd. vi. p. 691) isolated from a case

of purulent peritonitis a streptococcus which had apparently been the suppurative agent, and succeeded in producing erysipelas on the ear of a rabbit with a pure culture of the same streptococcus. When it was inoculated beneath the skin on the back of mice and rabbits it produced suppuration. This case is analagous to the one described by Knorr. Welch (*The Am. Jour. of the Med. Sci.*, 1891 p. 439.) compared these two streptococci, but was unable to detect any difference between them. He adds "The efforts to differentiate into distinct species the pathogenic streptococci have thus far met with little success, so that the weight of opinion favors the view that the streptococci of erysipelas, phlegmonous inflammations, septicæmia, puerperal fever and the various forms of angina belong to one and the same species."

In an article published in the *Supplement of the Report of the Local Government Board*, London, 1887, Klein discussed the various properties of a large number of streptococci which he had isolated from various sources. Among them were the two species under consideration. The results which he obtained led him to conclude that there was a difference between these two organisms. More recent writers, however, tend to group the streptococci rather than to differentiate closely allied if not identical species. This is important in view of the large number of affections that have been attributed to the action of certain streptococci. The experiments of Knorr are exceedingly interesting, yet he does not fully establish the identity of the two species as it was possible that there was a mixed infection. Pasquale (*Beitrage zur path. Anat. u. zur allgemeinen Path.*, Bd. xii, 1893, p. 433), in an exhaustive study of streptococci, points out the fact that two streptococci which were capable of being differentiated were found in the different organs of the same animal.

## SHOULD THE PRACTITIONER SUPPLY HIS OWN MEDICINE?

In reply to this query it must be said that, in the present state of medical affairs, as a general rule, in a vicinity amply supplied with competent pharmacists, the practitioner has no right to compound or to carry drugs to dispense with his own hand to the patient.

Holy Writ says that "the laborer is worthy of his hire." And so is the trained, qualified pharmacist. Pharmacy and medical practice, while a close affinity subsists between them, are separate and independent branches of the healing art.

The physician in a large city, who carries and dispenses medicines, by that act loses caste, he does an injustice to his patient, and appropriates to himself what justly belongs to the druggist who depends largely on prescriptions for his support.

It is alleged that the physician saves the patient the expense of prescriptions and so retains him. But the fact is he fails in both. In very many cases he might as well dose his patients with fragments of chips, pebbles or other inert substances as to give him the stale, petrified tablets which, with time, have lost their potency. His patient has no respect for the preacher-practitioner combination, nor has he any enduring faith in the walking apothecary shop, hence, when he is really seriously ill he will pay only for the straight article.

"Let the shoemaker stick to his last" is an old and true saying, If we would stop counter-prescribing, the pharmaceutical treatment of gonorrhœa and amenorrhœal (?) troubles, then we must give to the honest pharmacist what justly belongs to him. Pharmacists as a class are appreciative, and no physician ever patronized one and was not repaid two-fold. What we have said does not apply to the country practitioner, nor to the use of emergency drugs for night practice.

# BACTERIOLOGICAL NOTES.

## THE PYOGENIC PROPERTIES OF THE TYPHOID BACILLUS.

In a paper by Hintze (*Centralblatt. f. Bakteriologie u. Parasitenkinde*, XIV, 1893, p. 445) on the duration of time and suppurating properties of the typhoid bacillus in the human body, are recorded a few interesting facts concerning the properties of the typhoid bacillus. A man was admitted to a hospital ten months after an attack of typhoid fever, on account of a swelling over the tibia which appeared first four months after the attack of the fever and had continued to increase in size. This swelling was found to contain pus from which cultures were made. These developed colonies of bacillus pyocyaneus and of the typhoid bacillus. The identity of the typhoid germ was determined by a very careful study of the organism. Hintze believed after a careful study of the organisms obtained that the typhoid bacillus was the only germ present which could have produced the suppuration. This conclusion is contrary to those of Baumgarten and others who considered the typhoid germ to be devoid of pyogenic properties. The author cites another interesting case of typhoid fever where the patient died. The post-mortem showed that the cerebral meninges were in a state of purulent inflammation, and upon the examination of the pus only typhoid bacilli were found. Hintze brings forth reasons which he believes are sufficient to show that the pus was not produced by pyogenic cocci which had perished prior to the examinations. These observations led the author to draw the following conclusions:

1. That the bacillus of typhoid fever could live in the body for at least ten months.

2. That it is able to produce chronic post-typhoid suppuration.

3. That it can cause suppurative meningitis.

## TUBERCULIN IN TREATING PULMONARY TUBERCULOSIS.

Bey and Kartulis (*Zeitschrift f. Hygiene*, XV, 1893, p. 228) report the results of some very interesting work in the treatment of tuberculosis with tuberculin together with hygienic and climatic influences. They report 48 cases in which recovery was secured in 16 or 35 per cent. The article is a long one containing full details of the injections and their reactions, the condition of the patient as determined by physical examination, etc. The results which were obtained, as set forth in the conclusions drawn by the authors, are given:

1. Beginning pulmonary tuberculosis can be cured with tuberculin in from 3 to 4 months.

2. In more advanced cases of phthisis recovery is more slow, six months to a year being required.

3. Severe cases with not large cavities can, under good hygienic conditions, be cured.

4. Very bad cases with large cavities, hectic fever, and night sweats, are not suited to tuberculin treatment.

5. Skin tuberculosis, as scrophuladerma or skin ulcerations are rapidly healed with tuberculin.

6. Certain forms of bone and joint tuberculosis, also gland tuberculosis, are rapidly cured with tuberculin alone or with the help of surgical interference.

7. Tuberculin is a dangerous material unless it is given in small doses in the beginning.

8. Small doses of tuberculin alone will not produce recovery of tuberculosis.

9. The Egyptian climate is well adapted for the treatment of tuberculosis.

10. The clinical treatment of lung tuberculosis with tuberculin is indicated only in light cases, in more severe cases the treatment must be more regular and persistent.

The authors lay much stress upon the importance of climate and hygienic influences in bringing about good results.

# TRANSLATIONS.

IN CHARGE OF M. B. WERNER, M. D., AND W. A. N. DORLAND, M. D.

## A CASE OF PHOSPHOROUS POISONING.

Dr. C. Seidle, Königsberg, Prussia, reports a woman who, being pregnant, dissolved the heads of matches in water, and drank the solution with a view of producing abortion. The dose was taken on the evening of Oct. 28th. On the morning of the 29th, she was attacked with violent vomiting and complete loss of appetite and was unable to take anything but water until her death, which occured on Nov. 3rd. Having, on that day given birth to dead twins, she died suddenly during the expulsion of the second placenta.

An autopsy revealed a general hemorrhagic condition of the mucous and serous membranes, which were in many places emphysematous, the kidneys also showed hemorrhagic spots, and the pelvis was filled with coagulated blood; the bladder was empty; the uterus measured 21 cm. long, 15 cm. wide, and 6 cm. thick, was of a yellowish color except in places where hemorrhages had taken place. The liver was hard, light yellow in color, containing a moderate amount of blood; the gall bladder contained about a teaspoonful of of thin blackish-yellow bile. The mucous membrane of the small and large intestines, and pancreas were covered with hemorrhagic spots.

The thoracic cavity also showed many hemorrhagic changes. The pericardium was covered by numerous petechial surgillations; beneath the endocardium, especially near the valves, free hemorrhages had taken place. The same condition existed in the pleural cavity. The mucous membrane of the larynx and œsophagus were light yellow and hung in shreds. The brain was normal in appearance and no hemorrhages could be found in its membranes.

The points of peculiar interest in this case were the following:

The mother of the patient acknowledged that about one hundred matches had been used for the purpose, and that, in spite of the violent vomiting and loss of appetite, the patient worked until the 31st of October. The evening of that day she walked to the home of her mother, who lived in the same village.

The destruction of the vascular tissues, in particular, took place so rapidly that any pressure upon the integument was followed almost immediately by surgillations.

Some hours before death a severe form of tachycardia set in, pulse 130 to 140 per minute, the temperature remained normal. No microscopical changes could be demonstrated in the nerve tissues.

Another point of interest was the prompt interchange of the poison between the maternal and fetal circulation.

This method of inducing abortion seems to be confined to the eastern portion of Prussia.—*Vierteljahr fur gericht Med.* bund VI. heft 49-3. W.

## 'PORRO' FOR OSTEOMALACIA IN THE PREGNANT—RECOVERY.

A. P. Dekanski reports the patient, a multipara in the fourth pregnancy. The latter months of her second pregnancy had been accompanied by severe pains in the pelvic bones which ceased after completion of labor, but returned at the beginning of the third pregnancy; this condition made it necessary for her to remain in bed the greater part of that period. After labor the pains disappeared as before. The fourth pregnancy ushered in symptoms of greater gravity.

A careful examination disclosed the following:

The symphises approaching each other, formed a peaked-like projection. The rami of the pubis assumed a horizontal position parallel to one another, making it difficult for the examining finger to pass. The tuberosities of the Ischium were directed somewhat outward. The promontory of the sacrum could scarcely be reached. Pressure on the pelvic bone was painful. Pelvic measurements between the anterior

spinous processes, 22 cm., between the crests, 24½ cm.; external conjugate, 18½ cm.; diagonal conjugate, about 12 cm.; between the posterior spinous processes, 7 cm.; between the trochanters, 21½ cm. The uterus enlarged to about five months pregnancy. The patient miscarried soon after her admission to the hospital. The placenta however was not expelled and it was impossible to resort to manual means. The day following the labor, nature still failing in the expulsion of the placenta and the patient showing increased temperature, Dekanski concluded to operate.

He removed the entire uterus, ligated its ligaments. After removal he fixed the stump in the lower angle of the wound with sutures. The pains in the pelvic bones ceased on the fourth day after operation. Two and a half months after the operation there was but little tenderness left in the pelvic bones, the patient discarding her crutches and using a cane. Three weeks later the patient discarded her cane, and in nine and a half months the pelvic bones had entirely hardened and the pain had entirely disappeared.—*Memorabilien*, heft 7, Sept. 1893. W.

# ABSTRACTS.

## A CASE OF PUERPERAL ECLAMPSIA.

Dr. Ball reports (*N. Y. Med. Jour.*) a case of eclampsia at eight months and a half of pregnancy, and remarks upon the use of lithia water in the after treatment.

Mrs. M., a multipara, came into my hands during the latter part of April, 1890, for care during her approaching confinement, her regular physician being necessarily absent.

She was a large, fleshy woman, and inclined to take on adipose tissue rapidly. She had had some difficulty in her first confinement four years before, but since then had remained in good health. The case came into my hands at the beginning of the eighth month, the patient complaining of swelling of the feet and ankles and some headache.

I at once tested the urine and found it in about half the usual quantity, and albumin about a fifth per cent.

She was at once placed upon the usual prophylactic measures, with strict admonition concerning diet, consisting chiefly of milk. The urine was daily tested, and, in spite of keeping the system depleted by means of cream of tartar and petassii acetas, twenty grains every six hours, for its diuretic and cathartic action, also Epsom salts, the urine remained small in quantity with albumin increasing.

Seeing these spmptoms continue, the question arose as to the advisability of inducing labor at once, as the child was known to be alive.

Finally, in accordance with the conservatism of most authorities of the day, since no actual convulsion had occurred, although I anticipated an outbreak at any moment, I decided to await Nature's developments.

Just two weeks from the time I first saw the case, at eight months and a half, I was hurriedly summoned by the husband at 6 A. M., who stated that his "wife was dying."

I rushed into her room and found her in a severe convulsion. As I entered she exclaimed, "Oh, my head!" I at once injected hypodermically a quarter of a grain of morphine with one one-hundred-and twentieth of a grain of atropine. No effect was produced except a transitory lessening of the convulsions, but they continued to come and go.

I at once summoned a brother medical officer in consultation, meanwhile attempting to control the spasms with chloroform. On his arrival we agreed that if venesection did not stop then, premature delivery would be necessary. An attempt to find the median basilic vein proved utterly futile, owing to the enormous quantity of fatty tissue lying over these veins. Seeing this, the spasms increasing in violence and frequency, a fatal result to both mother and child was feared. Chloral, twenty-five grains, and bromide of potassium, forty grains, were now given by enema. Venesection was abandoned and Barnes's rubber dilators, beginning with the medium size, were inserted into the os uteri successively and retained about ten minutes each. These

"dilators" were filled with cold water by means of an ordinary Davidson bulb syringe attached to their tubes.

In half an hour the dilatation was complete. The forceps was easily applied and a large female child was extracted. Of course, it had been destroyed by the violence of the convulsions, During this whole time the woman was wholly unconscious and remained so for thirty-six hours afterward.

Just here I may add, in speaking of venesection above, that when it was found impossible in the arm, recourse was had to four large wet cups directly over the kidneys. Ordinary glasses were used and about a pint of blood was extracted.

This undoubtedly lessened the frequency of the attacks for the time, during which time the dilatation was accomplished.

After emptying the uterus, contraction took place, so that very little blood was lost. Free action of skin was encouraged by the application of hot bottles, etc. Urine removed by catheter was small in quantity, very dark, and heavily laden with albumin—three quarters per cent.

No recurrence of the convulsions took place, though the patient remained drowsy and semi-conscious only for the next twenty-four hours. Copious antiseptic douches, very hot, were used daily thereafter for three weeks. Temperature did not exceed 100°. Diet was limited to hot milk with the free use of water. The urine was accurately tested daily as to quality and quantity. The albumin at delivery was a half per cent. with granular casts. The estimated urea in twenty-four hours for several days was only two hundred and fifty grains. As a result, uræmic symptoms continuing, the patient was put upon Buffalo lithia water *ad libitum*; no other water allowed. About three quarts were drunk daily at first. The urine increased in quantity by next day, color improved, quantity of urea increased to three hundred grains. Head symptoms improved. No medicine was given except to keep the bowels open. This lithia water was depended upon wholly in increasing quantities. At the end of six weeks the patient was in good condition and her urinary functions were almost normal. She then decided to go off for a visit to a neighboring public resort, in order to try the effect of a chalybeate water said to have proved excellent in kidney troubles.

One week's sojourn there produced such discomfort, constant headache, puffing around the ankles, and general malaise that she returned. Examination showed that the urine was only thirty-two ounces in twenty-four hours: albumin, one quarter per cent; some casts; urea, two hundred and sixty grains.

The patient was placed upon the former treatment, with immediate improvement in every way. The lithia water was gradually increased until urea showed five hundred grains in twenty-four hours, and seventy-five to eighty ounces of water passed daily.

The patient then rapidly convalesced and made a complete recovery.

The patient being of a heavy, plethoric type, I believe the chalybeate water was decidedly injurious.

The marked benefit as a result of the natural lithia water shows the power of this drug, in its natural state of solution, in dissolving the rapidly accumlating urea out of the minute uriniferous tubules, thus removing this vital poison, always so prominently existing in these cases.

No more trying conditions ever confront the attending physician than these cases of ante-partum, intra-partum, or post-partum eclampsia. In the first two conditions we have to deal with the problem of two lives. Given the conditions of a living child, at seven to eight months and a half, with the mother showing marked symptoms of impending eclampsia, shall we procrastinate, temporize by the various means usually adopted, till finally we are forced to act after the explosion has occurred, and probably extract a still-born fœtus?

In the above-reported case might I not have saved one life by interfering sooner? This child was certainly viable soon after the case came into my hands.

The discussion of Dr. Green's interesting paper on Eclampsia, in the *American Journal of Obstetrics* for July, 1893, at the meeting of the American Gynecological Society, shows a marked difference of opinion among medical men as to our capability to prevent entirely the full development of puerperal eclampsia when we have had charge of the case early.

I certainly believe with those who realize our total inability to prevent this

climax, no matter how watchful we are in the early stages of many cases.

Of course, up to the seventh month the advisability of every conservative measure will hardly be questioned by any one.

I have seen nothing in the journals concerning the free and persistent use of lithia water in the very earliest stages of these cases.

I believe, if this were more generally adopted, many of them would escape the further development of the insufficient renal function.

My only reason for presenting this case is to call attention to its beneficial effects.

## THE ETIOLOGY OF CANCER.

Professor Duplay and M. Cazin discuss in the *Semaine Médicale,* some of the more recent assertions made in various quarters on the etiology of cancer. In connection with the possibility of a more or less direct transmissibility of cancer from one member of a household to another, or among the inhabitants of a locality, the evidence is very meagre. Arnaudet asserted the frequency of cancer in the Canton of Coremeilles, where it exists in somewhat epidemic form and localized to certain districts. Arnaudet suggested that the disease was conveyed through drinking water, and especially cider made with contaminated water or by defective sanitation of dwellings. Professor Brono's subsequent investigations, however, failed to afford any corroboration. Fiessinger traced four cases of cancer in three houses to contamination, apparently with the dressings from a case of scirrhus of the breast. Guelliot and Fabre collected instances of "house-epidemics." In this connection Metchnikoff's hypothesis must be borne in mind that cancerous neoplasms might possibly belong to the group of miasmatic diseases capable of being propagated by spores formed outside the organism.

It has long been known that cancer is easily disseminated throughout the organism by cancerous particles detached from the primary growth and deposited in the various organs and tissues. Secondly, experiments on the human subject have shown that the inoculation of cancer to patients already suffering from the disease is not necessarily followed by positive results, though some have been observed.

Several investigators have recently claimed to have successfully inoculated human cancer to rats and mice, but a long series of prior attempts were apparently unsuccessful, and the more recent ones are open to doubt. In the inoculation from one animal to another of the same species negative results were obtained by numerous investigators, but on the other hand a few positive ones have been arrived at, viz., by Goujon (epithelioma in guinea-pig), Klencke (melanotic carcinoma in the horse), Wehr (carcinoma in the dog), Hanau (epithelioma in the rat), Eiselsberg (filio-sarcoma in rat), and Morau (epithelioma in mice). Hanau's well-known results are very striking.

Quite recently Morau has presented to the Academy of Sciences the following conclusions arrived at in his continued experiments.

1. White mouse epithelioma is inoculable from one animal to another of the same species.

2. Hereditary influences play a very important part in the development of these tumors.

3. Secondary growths are apt to form in various parts of the body, the development of these metastatic formations being favored by an injury to the tissues or organs.

4. Gestation produces the same effect as traumatism.

5. Certain toxines are produced in the substance of these tumors. They are absorbed into the system giving rise to general cachexia.

6. These tumors apparently loose their virulence by successive transmission through a series of animals of the same species.

7. So long as the skin is unbroken these tumors are apparently free from bacteria.

8. Picric acid seems to exert a favorable influence on these tumors by coagulating the protoplasm of the cells. For this purpose it must be brought directly into contact with the pathogenic cells (interstitial injections).—*Jour. Cuban and Genito Urin. Dis.*

# THE LIBRARY TABLE.

## BOOK REVIEWS.

*Text Book of Normal Histology*, including an account of the development of the tissues and of the organs, by George A. Piersol, M. D., with four hundred and nine illustrations, of which three hundred and fifty-eight are from original drawings by the author. Philadelphia. J. B. Lippincott Co., 1893. 429 pp.

It is not every day that the reviewer of science text books has the pleasure of commenting upon a work approaching so near perfection as that now under consideration. Dr. Piersol, for many years assistant to, and finally successor of the late Professor Richardson in the Histological Laboratory of the University of Pennsylvania, and afterward of our lamented Leidy as Professor of Anatomy, brings to his work a knowledge based upon long practical observation both here and in the best known laboratories of Europe. The portfolio of histologic photomicrographs issued by him several years ago, gave ample testimony to the delicacy of his technique, and the works of several local authors have long born witness in their illustrations to the character of his work with the pencil and camera lucida; while those cognizant of the importance of neatness and method in the various steps of the preparation, staining and microtomy of tissues, could require no greater assurance as to the author's fitness for this work, than could have been had at almost any time during the past decade by a visit to his private work room.

The book on Normal Histology now before us, is but the natural and adequate fruition of a training and aptitude enjoyed by few. It is a pleasure to open a text book on a microscopic science which enters at once upon the subject proper without the traditional chapter on the structure and use of the microscope, an instrument now familiar in every household. A similar sense of relief is experienced in finding the details of staining, embedding, sectioning, etc., relegated to the back of the book, accompanied by a discriminating choice of methods and reagents.

The book is what it claims to be, a treatise on normal histology and the subject is handled with perspicuity, combined with an up to date thoroughness which leaves little to be desired. We find nerve histology, for example, illustrated with new and fresh drawings, showing the results of the latest discoveries based upon the Golgi gold and silver method, from the author's own pencil or that of Ciacco, Lenhossek and other modern investigators, rather than by the time honored cuts of Stricker, Henle, Krause, Kuhne, etc. We are pleased to note the inclusion of discoveries by local investigators, as for example the intra-fibrilar capillaries of the heart muscle described by Meigs. The text is enlivened by the use of heavy faced type for the more important names and phrases, and throughout compares favorably with the beautiful press work of the books by Lang, Korschelt, Hertwig, and others, issued within the last year or two by Macmillans. There are a number of minor points open to criticism, chief among which is the entire absence of bibliographic references, so useful to all who wish for something more than dogmatic statement and who desire to refer to original sources, especially in matters of dispute.

We cannot avoid feeling that the value of the book would have been greatly increased, had the author made his treatment more comparative and brought to bear the many apt illustrations to be drawn from recent investigations in the histology of the invertebrates and lower animals. The reader is given no inkling of the diversity of opinion regarding the phagocytes of Metschnikoff, or the origin and nature of the mesoderm, nor is any suspicion aroused of the fight that is being waged about the nucleus by students of the cell, from the standpoint of physiology and heredity. That most important and wonderful of all cells, the ovum, is passed over without a suggestion that the animal ovicell varies greatly in its internal arrangement and external environment in the different animal types; while the normal histology of the imperfect organs of embryonal life is touched upon in a manner which scarcely realizes the hopes held out by the subtitle of the book.

To be sure the work is intended primarily as a text book for medical students, but even they would not be harmed by being impressed with the value of comparison in connection with observation and the suggestion now and then that all normal histology is not human or mammalian histology nor the histology of adult structures.

*Manual of Bacteriology*, for Practitioners and Students with especial reference to practical Methods, by Dr. S. L. Schenk. Translated from the German by W. R. Dawson, M. D. with 100 illustration partly colored. London, and New York; Longman's, Green, and Co., 1893.

The rather harsh criticisms of the original editor of Dr. Schenk's book in the Vienna *Medical Journal*, and the more recent review in the Dublin *Medical Journal*, smack strongly of personal feeling, directed on the one hand at the author, Professor extraodinary in the University of Vienna, and on the other, at Dr. Dawson, Travelling Prizeman of the University of Dublin. Viewed from the standpoint of the ideal, the book undoubtedly has its faults; few treatises above criticism are to be found, especially among text books; but compared with existing books on bacteriology, Dr. Schenk's is a valuable contribution, and the peer of almost any in the long list of publications on the subject.

For the busy practitioner and student it strongly commends itself, inasmuch as the pages are not loaded down with historic or polemic detail, but the bacteriological analyses of air, water, earth, articles of diet, pus, organs and cavities of the body, feces and urine, nasal and other secretions, and the

blood are treated of systematically and in a way that presents the results and methods of investigation in the respective fields without waste of space or the reader's patience. That the translator has not altogether escaped the obscurity, inherent in the language of the original, is evident now and then, but in no wise affects the intrinsic value of the book.

The fact that the publishers have left nothing undone to make this a beautiful example of modern book-making is evident in the large clear type, wide margins, fine paper, and excellent illustration and adds largely to the value of the book. To those who have no inclination for the exhaustive presentation of the subject given by Sternberg in his recent, voluminous treatise, but who wish to have it placed before them, as from an intelligent and experienced teacher to his pupils, we would commend this work.

---

*Les Troubles du Language Chez Les Alienes.* Par J. Seglas, Medecin Suppleant de la Salpetriere, etc., etc., with 17 figs. in the text. 299 pp. Paris. J. Rueff et Cie., publishers, 1892.

This elegant little work, which forms a number of the Charcot-Debove library, considers the subject of the written and spoken disturbances of speech of the insane, and is the first complete contribution to the study of this subject. In the year 1891, the writer gave a number of lectures on this subject at the Salpetriere and these form the skeleton of this work. It is a welcome addition to our knowledge of this subject, for without understanding the various disturbances of speech in the insane, many of the symptoms will pass unperceived, or be misinterpreted, and hence many precious indications for diagnosis, prognosis and treatment may be neglected. Again, if one but remember that all insane persons, excepting slight variations from social medium, education, etc., of all times and countries express themselves in the same manner in their delirium, one will see the importance of familiarizing oneself with their language. After a few preliminary chapters on the division and general plan of the subject, the development of language in idiots and imbeciles, he enters into the consideration of the disturbances of spoken language, with its various abnormal modifications and illustrates it with examples and cuts. The second portion treats of the disturbances of written language, which is carefully and comprehensively traced and studied in its many details with admirable industry and breadth of experience. The third and final section is consecrated to the abnormalities of gestural language, mimic language, and its relation to intellectual disturbances. The book is one which fills a gap in our knowledge of this subject, and which will be the source of much instruction to those working in this department.

# CURRENT LITERATURE REVIEWED.

IN CHARGE OF ELLISTON J. MORRIS, M. D.

---

THE KANSAS CITY MEDICAL INDEX for December. Dr. C. F. Wainwright contributes a paper on the

**Early Diagnosis of Carcinoma of the Stomach.**

The author believes that in the near future, by the help of modern means of diagnosis of diseases of this organ, and assistance of able surgeons, the profession may look forward with some degree of hope to rescuing a fair percentage of such cases as may be made the subject of early study and treatment. The author advises the chemical examination of the contents of the stomach as confirmatory evidence of the disease. The emptying of the stomach should take place after the administration of a test meal, the time depending entirely on the nature of the meal. The author prefers the test meal of Ewald as the simplest and best. This consists of one water roll, weight 35gr. and a cup of tea or water; this meal can be taken from the stomach one hour afterwards in a fluid form, while the trial meal of Riegel and others, consisting of beef-broth and bread, is much more complex and cannot be removed in fluid form for several hours.

Dr. Lewis Schooler discusses

**Appendicitis in its Relationship to Life Insurance.**

The author believes that if the present accepted views are correct in regard to one attack of appendicitis predisposing to another and finally to a state of chronic inflammation of the organ, then all persons who have been the subjects of this disease and have not undergone an operation for its relief should be rejected by the examiner to whom the history is given. The time which must elapse after an attack before the risk may be considered a safe one can only be determined by the observation of a large number of cases treated by the expectant method without surgical interference. Much information would be gained if cases treated by the expectant method were promptly reported. The author states that no case with suspicion of chronic appendicitis should be accepted. But where there is a history of a single attack without recurrence within a space of twelve months he would be inclined to class the applicant among the desirable risks. Where there have been two or more attacks within one year the risk should not be accepted until at least two years have elapsed without a recurrence. Where there have been repeated attacks covering two or more years the risk should be rejected.

**Some Points in Regard to Colotomy**

is the title of a paper by Dr. Emory Lanphear. The author states that, under modern

antiseptic methods, inguinal colotomy is always to be preferred to the lumbar variety. The classical method of performing the operation by bringing up the bowel, stitching it into the wound and opening the side of the gut he does not consider a good method of procedure and would adopt it only when certain that a restoration of the natural channel at some future time might be impossible. The operation he prefers is complete division of the gut, inversion and dropping of the lower end and suture of the upper to the margins of the wound. The objection to colotomy that the subsequent life of the patient is a miserable one is not sustained by his experience; he has found that the general condition improves greatly and even if the malignant disease cannot be removed the life of the subject is prolonged for a year or more, the cancer developing much more slowly than before colotomy; and the patient is free from the pain and irritation consequent to the passage of fæces over the diseased area.

Dr. T. N. Taylor discusses

**The Modern or Mechanical Treatment of Trachoma.**

After reviewing the various methods of treatment, the author comes to the conclusion that the treatment by systematic expression gives the best results. He has found the Knapp roller forceps very satisfactory for the central portion of the lids, but at the angles the Prince instrument is more manageable. However, the mechanical devise is by no means so important as a determination on the part of the operator to bring away as completely as may be the whole contents of the follicles. All is complete after the surfaces are wiped and the bleeding, which is rather favorable than otherwise, has ceased. The lids at once swell to several times their natural thickness and on the following day may show a general ecchymosis. No treatment beyond careful cleansing is necessary in the majority of instances, but at times the reaction may require the application of iced cloths for twelve to thirty-six hours, and their use is always grateful to the patient. After a few days the application of weak solutions of silver, glycerate of tannin or even sulphate of copper crystals may be resumed with benefit in some cases. A variable time is required before the roughened membrane becomes smooth, but a reappearance of granulations is extremely rare. From two to six weeks suffices for the cure of ordinary uncomplicated cases where as formerly six to eighteen months was the average expectancy.

Dr. L. Reynolds reports

**A Case of Ruptured Uterus.**

The author was called in consultation after the accident happened and is therefore unable to say whether the case was one of spontaneous occurence, or was assisted artificially. Some of the conditions present were favorable for its production without artificial aid, such as a small pelvis and an unusually large child, together with the age of the patient (26 years). No ergot had been given. There was also present a possible artificial cause such as the repeated application and slipping of Naegeli's forceps, previous to the author's arrival. On the author's arrival the head of the child was found presenting but not engaged. On re-examination by the attending physician the head was found to have receded. The patient was anæsthetized and the child extracted with forceps. The placenta not being expelled, the author introduced his hand within the uterus to extract it and discovered a complete longitudinal rent extending from the cervix upwards beyond the center of the uterus. A proposition to perform an immediate laparotomy was opposed by the attendant on account of the necessary intervention of a priest whom it required a day or two to get. "By the time the priest arrived septic symptoms had set in and the patient was left to the inevitable. Death occurred on the third day." Until the removal of the placenta, rupture had not been suspected, and except for the reporter's careful examination at the third stage of labor its occurrence might have been entirely overlooked and the result attributed to some post puerperal change. From his observation in this case the reporter believes that a large percentage of the cases of rupture of the uterus are never recongnized.

[This case forcibly emphasizes the dangers of delay, which in this case one is inclined to call criminal.—Ed.]

The remaining papers in this issue are: the "Report of an Operation for Glioma" by Dr. G. R. Rucker; "Legal Injustice to the Insane" by Dr. B. D. Eastman, and "The Treatment of Appendicitis" by Dr. John B. Deaver in which the author reiterates the opinions expressed in a former paper, a review of which was published in The Medical and Surgical Reporter for October 7, 1893, page 579.

---

THE UNIVERSITY MEDICAL MAGAZINE

for December. Dr. Harrison Allen discusses

**The Etiology of Fracture of the Lower End of the Radius.**

The author concludes that the generally accepted proposition that the accident is the result of a fall upon the palm or ball of the thumb is not satisfactory and is in part erroneous. He believes that when the arm is thrown in front of the body, as in the act of falling, the impress is received upon the part of the palm answering to the little finger, and not upon the palm as whole, or upon the ball of the thumb. What takes place can be formulated thus: As a result of violent contact of the hypothenar portion of the palm against the ground, the hand is first pressed upward (not backward)—that is to say, in a direction as though the forces were exerted on the hypothenar side of the palm and were to traverse the palm to the thenar side and the direction is upward since the hand is midway between pronation and supination. Secondly, the force of the impact is measurably transferred to the center of the palm obliquely inward and backward. The act of a violent and unexpected fall throws the entire weight of the body upon the unrelieved hand, with the result of wrenching the hand inward and upward from the

hypothenar side and impacting the radius against the carpus. In this fashion are created all the several lines of the lesion.

**The Operative Treatment of Knee-joint Disease**

is the title of a paper contributed by Dr. De Forest Willard. After duly considering the various operative measures, the author comes to the following conclusions :

1. Mechanical treatment by rest, fixation and the use of crutches, either axillary, perineal, or ischiatic, is absolutely essential both before and after operation.

2. In children under 12 years of age conservative measures should be carried to the extreme, and all operative procedures should tend to non-interference of the epiphyseal line for as long a period as possible, in order to assist growth of the limb. In these young cases, therefore, tenotomy with subsequent fixation should be the primary procedure, to be followed by erasion when necessary, and by excision only when life is absolutely threatened.

3. From 12 to 15 years of age conservatism should still be the rule, although the dangers from a shortened limb subsequent to operation are not so serious after growth has been completed. In adults operative treatment should be early and more radical in character, erasion still being preferable to excision, except in very degenerated cases.

4. Amputation should be employed in children only as a "dernier resort;" in adults with extensive disease it is often a wise procedure.

5. The introduction of the anti-bacillary substances, both extra- and intra-articular, offers hope of retardation in the growth of bacilli, but as yet the procedure is in the experimental stage.

6. After the subsidence of all inflammatory symptoms the late deformity should be overcome :

a. By tenotomy, with forcible replacement.

b. By excision ; rarely by osteotomy.

Dr. William S. Carter contributes a paper

**The Globulicidal Action of Blood-Serum,**

detailing a number of experiments, as the result of which he comes to the following conclusions: Of the different blood serums used in these experiments, the most toxic and the most actively globulicidal is human serum injected into rabbits. When injected rapidly into the veins it causes death in a very few minutes, the corpuscles being diminished to one-half or one-third their normal quantity; when injected slowly, death comes on much later, the corpuscles being reduced to one-fifth their normal. Upon dogs human serum has neither a toxic nor globulicidal action. With frogs there is a decided globulicidal and toxic effect.

Dogs' serum is toxic when injected rapidly into the veins of rabbits; when injected slowly, in some cases death comes on with slight diminution of red blood-corpuscles, while, in others recovery occurs even after the use of 30 cc., and there is but slight alteration in the number of corpuscles.

The serum of the horse is neither toxic nor distinctly globulicidal, when injected into rabbits.

The serum of the cat does not appear to be toxic nor globulicidal when injected into the rabbit.

Serum of the sheep is neither toxic nor globulicidal for cats.

Heat destroys both the toxic and globulicidal action, but these properties are not lost by standing in a cool place for one week.

There is no great alteration in the number of leucocytes, except that they seem to be reduced in number when the red blood-corpuscles are destroyed.

When human or canine serum is injected into rabbit the proportion of lymphocytes seems to be increased, while the multinuclear, or oldest of the leucocytes, are correspondingly diminshed.

When the serum of the horse was injected into the rabbit there was a slight diminution of lymphocytes, while the multinuclear form was more abundant.

From the fact that the serum of the dog is toxic for rabbits, without having any decided globulicidal effect, and also that human serum injected rapidly into rabbits causes death in a few minutes, before the corpuscles are reduced below one-third their normal, while the slow injection causes a reduction to one-fifth of the normal number before death, it seems probable that the toxicity is not dependent upon the globulicidal action, and indicates a multiplicity of poisonous substances in the serum. The fact that heating destroys these actions indicates their albuminous nature.

The experiments made by the author show that the corpuscles of an animal are not destroyed by *any* foreign serum. The only serums exerting a toxic or globulicidal action were those of flesh-eating animals—man and dog—while serum from man had no effect on the dog. But serum of the cat had no effect upon the rabbit.

In those cases in which death occurred from the injection of human or canine serum, a cardiac thrombus was never found, but the ventricles were distended with fluid blood, often containing dark, non-adherent and very soft clots—such as form at the agonic period of death.

Dr. James Hendrie Lloyd contributes a paper on "Pacchymeningitis and Myelitis from Pott's Disease, and Septic Neuritis of the Cauda Equina from a Bed-sore over the Sacrum." The author believes that the essential disease-process that involves the cord and its membranes in caries of the spine is an actively infectious one, causing first pacchymeningitis, and later a meningo-myelitis, and that bone pressure as an active cause in the impairment and destruction of the cord, is of strictly secondary importance, and in the majority of cases of no importance whatever.

Dr. Charles A. Oliver reports "The Clinical History of a Case of Spindle-celled Sarcoma of the Chorioid, with a Study of the Microscopic Condition of the Growth."

The remaining papers in this issue are: the report of a case of "Congenital Absence of the Vaginal Cervix" by Dr. C. B. Penrose; and the report of a case of "Symmetrical Hemorrhagic Infarct of Both Lungs" by Dr. Frank Massey.

# PERISCOPE.

IN CHARGE OF WILLIAM H. BRICKER, M. D., B. SC.

## MEDICINE.

### The Clinical Course, Diagnosis and Structure of Duct Cancers or Villous Carcinomas of the Breast.

Anthony Bowlby has contributed a valuable paper upon this subject, and his conclusions are as follows:

"1. In a considerable proportion of the cases there is at some time a discharge of fluid from the nipple, and this discharge may precede the development of any tumor perceptible to the patient for a period of even several years. The growths are, however, not associated with so-called eczema of the nipple, or Paget's disease.

"2. The patients are mostly over middle-age.

"3. The axillary glands are not usually affected.

"4. The tumors are not of very rapid growth.

"5. Neither the nipple nor the skin is usually retracted, but the growths are commonly situated near the nipple.

"6. The tumors are occasionally multiple in the same breast, and are firm and elastic, or else shotty and knotted to the touch rather than hard and nodular like a scirrhous carcinoma.

"7. On section, the growths are seen to be encysted, and are generally darkly blood-stained, soft and friable. Sometimes they are of a lighter color, and grayish and granular on the surface. Some of the cysts are almost filled with solid growths, others contain little but blood-clot and serum. It can often be plainly seen with the naked eye that some of the cysts are formed by dilated ducts, and the solid growth can often be seen springing from the lining membrane of the latter. The cysts and the growth may be situated either in the gland or in the surrounding fat. Occasionally, the tumor may protrude through one of the dilated ducts on the summit of the nipple.

"8. The tumors are liable to recur locally, but are not nearly so prone to affect the lymphatic glands or to disseminate as are the spheroidal-celled scirrhous carcinomas. If attention be paid to these points, I think no difficulty will be found in diagnosing these tumors from scirrhous carcinomas. Sometimes there is difficulty in separating them clinically from the cystic sarcomas.

"With regard to this the following points are worthy of attention: Duct cancers occur frequently in old women, in whom the growth of cystic sarcoma is relatively uncommon; they do not attain so large a size, nor do they grow so rapidly as do the cystic sarcomas; the cysts they form are usually much smaller than are the cysts in the latter class of growth; the discharge from the nipple is usually much more blood-stained."—*London Lancet.*

### Inoculation of Measles.

Dr. Hugh Thompson, of Glasgow, describes nine cases in which he had inoculated children with fresh serum taken from blisters on patients suffering from measles. He believes that four were rendered immune, and that in two the experiment failed. At the point of insertion of the serum slight measly looking patches appeared in from one to two days, and lasted for two or three days; accompanied with slight catarrhal symptoms. The serum is taken from small blisters no larger than a measly patch, and used immediately, and inserted by superficial scarifications.—*Pract. and News.*

### The Human Nasal Canals as related to Climate and Pulmonary Disease.

Dr. William C. Braislin shows that in negroes the nasal canals are wider, shorter, and less deep than in other races, and thereby less protection is afforded the lungs. The author believes that the African nose, being adapted to a tropical climate, is not suited for the colder climates, and that in this lies the greater susceptibility of the negro to consumption and other diseases depending upon irritating qualities in the atmosphere.—*Science.*

### Importance Attached to the Conditions of the Tonsil.

Dr. John W. Farlow calls attention to the prominence given the tonsils by the act of gagging, which forces them forward and toward the median line, cutting off the view of all that lies beyond. Moreover, the difficultry of posterior rhinoscopy and the mystery surrounding the function of the tonsil all unite to direct the physician's attention to these little bodies. The examination of the tonsils should be conducted while they are in repose, so that any changes in the adjoining tissues may be recognized and properly treated. The author shows that the symptoms usually ascribed to large tonsils may likewise be due to other causes (adenoid disease, etc.), and he would have these eliminated before resorting to tonsillotomy.

In conclusion, he presents the following summary:

1. Because the tonsils are easier to see than the nose and post-nasal space, is no sign that they are more important than the latter.

2. Form no estimate of the size of the tonsils unless you see them in repose.

3. Always examine the back teeth and the base of the tongue.

4. In acute follicular disease of the tonsils, look for and treat disease of the other follicular tissue in the throat.

5. Nasal obstruction, cough, and impaired voice are much more likely to be due to nasal

or post-nasal hypertrophy than to tonsillar.

6. The fact that the tonsils are enlarged or diseased should lead us to look for a possible explanation in the parts higher up.

7. Free the nose and post-nasal space in addition to, or instead of, tonsillotomy, if you wish to improve the voice and respiration.—*Boston Medical and Surg. Jour.*

### Vaseline in Certain Affection of the Middle Ear.

Dr. Delstonche (*Le Bulletin Medical*, 1893) speaks highly of injections of liquid vaseline in adhesive affections of the ear. He injects it through the Eustachian tube into the tympanic cavity. It is perfectly inocuous, and from an experience extending over several years he finds it of value.

1. To rupture extensive adhesions of the tympanic membrane with the wall of the labyrinth where insufflation of air, etc., are found insufficient. He has had several cases of partial success with forced injections of the liquid vaseline.

2. To clear out mucous accumulations from the tympanum during the course of certain chronic catarrhs. It forces the mucous into the mastoid cells, where it no longer interferes with hearing, or into the pharynx.

3. To diminish the chances of inflammatory reaction after paracentesis of the tympanum, where the matter filling the tympanum is dense or viscid, and will not evacuate itself spontaneously in a satisfactory manner. Here, from its inocuity, it is to be preferred to any other liquid.

4. To open an obstructed Eustachian tube when mucus blocks it and prevents insufflation of air, a few drops of vaseline blown through the catheter will clear it at once. Hence this simple means is always to be tried before dilatation with sounds is attempted.

5. Finally, in acute inflammation of the middle ear, either with or without perforation, especially in purulent otitis complicating influenza, massive injections of liquid vaseline saturated with iodoform render signal service, from their sedative action upon the atrocious pains which often accompany this affection. They also appear to hasten and aid to a favorable termination.

### The Administration of Milk by Accurate Dosage.

Patients frequently declare that they cannot take milk. The difficulty, however, is not with the milk, if due care is exercised to obtain a pure article, but is due to the uncertain method of its administration. Very few patients can commence abruptly and take two or more quarts per day, as such quantities are likely to upset the stomach.

The writer has had prepared a graduated glass for the administration of milk, indicating the number of tablespoonfuls from one to twenty, as well as the hours for taking the milk in the morning, afternoon, and evening, which he calls a "milk-tumbler." Such a tumbler is a great convenience for use in private as well as in attendance on "rest-cure" cases.

The writer has seen very good results follow the proper administration of milk in cases of great irritability of the stomach, chronic dyspeptics, and the like. By commencing at seven o'clock in the morning and stopping at ten o'clock at night we have eleven times for giving the milk, so that the quantity of milk daily taken can easily be reckoned.

Sometimes it is well, in commencing the milk course, to allow the patient three simple, easily-digested meals of selected articles a day, in conjunction with small but gradually increasing doses of milk. As the quantity taken reaches two or more quarts daily it is well to omit one or more of the meals, until the absolute milk diet is finally obtained.

When milk is given with a view to affording the digestive organs absolute rest, then milk only should be permitted for at least five weeks, or longer, according to the case and the character of the symptoms. Even after recovery it is always well to recommend the patient to take at least a quart of milk daily for an indefinite time. In the great majority of cases the milk will prove very grateful to the patient subsequent to undergoing this treatment.—Thomas G. Morton, M. D. in *Food*.

### Complications of Vaccination.

Epstein reports two cases of purpura and fourteen of erythema developed in the course of four hundred and thirty vaccinations. The cases of purpura occurred in children 12 and 4 months old, respectively, the hemorrhage spots being of varying size, appearing four days after vaccination, gradually disappearing in the course of a week, and preceded by agitation, insomnia, and fever. In the first child, which was rachitic, the spots occupied exclusively the left superior extremity, especially its entensor surface; in the second case they were distributed upon the extremities and the trunk. In both the vaccination proved successful, the vesicles at no time, however, being hemorrhagic. Five days after the attack of purpura measles developed in the first child, the eruption being quite distinct from the petechiæ. Of the fourteen cases of erythema, the eruption appeared in one on the fourth day, in one on fifth day, in one on the sixth day, in five on the seventh day, in two on the eighth day, in three on the ninth day, in one on the tenth day, and in one on the eleventh day after vaccination. The distribution of the eruption followed no particular course. Most often it appeared about the inflammatory areola of the vesicle and, at the same time, upon the extensor surfaces of the arm and forearm; often it appeared on the postero-external aspect of the thighs, upon the thorax, and upon the sacrum. The erythema resembled the exanthema of measles. It developed in the course of from twenty-four to seventy-two hours, and persisted, ordinarily, for from six to eight days.—*Jahrbuch fur Kinderheilkunde*, B. xxxv, p. 442, 1893. —*Universal Med. Jour.*

### The Effect on Sucklings of Purgatives Administered to the Mother.

Observations were made on forty-two cases, and the only conclusions that could be drawn were:

(1) Sulphate of magnesia administered to the mother frequently causes looseness in the sucking child; and

(2) Senna, cascara sagrada, and aloes rarely affect the child's bowels when administered to the mother.—*Ex.*

### Prize of the American Neurological Association.

The American Neurological Association offers a prize of $200 for the best essay on any subject connected with Neurological Science.

This competition is open to physicians who are legal residents of states in North and South America.

Essays must be sent to the Secretary of the Association on or before the first day of May 1894.

Each essay shall be accompanied by a sealed envelope containing the name and addresses of the author, and bearing on the outside a motto, which shall also be inscribed upon the essay.

Essays shall be type-written, in either the English or French Languages, and with the pages securely fastened.

The Council of the Association reserves the right to reject any or all essays judged unworthy of the award.

Each essay must exhibit original research, and none will be accepted that has previously been published.

GRÆME M. HAMMOND M.D., *Secretary.*

58 West 45th Street, New York City.

### What Benefit can Ear Patients Derive from Nasal Treatment?

H. Gradle (*Jour. of Amer. Med. Assoc.*) arrives at the following conclusions:

1. Acute suppurative inflammation of the middle ear, if not treated, has a tendency to become chronic, the tendency increasing with the age of the patient.

2. Chronic suppuration of the middle ear rarely heals without ear treatment. Neither acute nor chronic purulent ostitis are influenced by nasal treatment, but the liability to relapses after their cure is decidedly lessened by the removal of naso-pharyngeal anomalies.

3. Acute catarrh of the middle ear will generally terminate in complete recovery under aural treatment and sometimes even without it, provided there are no persistent nasal or pharyngeal lesions. But, when these are present the disease is more likely to become chronic in spite of aural treatment, and in many instances can either not be cured, or, if improved, will speedily relapse unless the normal state of the nose and throat is restored.

4. Proliferating or adhesive disease of the middle ear is the consequence of retro-nasal catarrh, and its course is determined by the course of the disorder causing it. Aural treatment alone is practically useless in this form of trouble, while nasal treatment, if successful so far as the catarrh is concerned, will also arrest the ear-disease. The restitution of hearing, however, depends on the length of time the disease has lasted, and is often aided by ear treatment after the cure of the retro-nasal catarrh.

---

### Engelman (R.) on a Contribution to the Study of the Accidents of Vaccination.

Conclusions:

1. Variola is communicable as an air-borne and air-exit contagium.

2. Its specific virus has not been isolated.

3. Its identity with vaccinia is undetermined.

4. The failure and non-protective character of vaccination is due to vitiation of the vaccine supply.

5. This vitiation is (1) saprophytic,, annulling the specific quality of the virus, or (2) pathogenic, inflicting injury upon the individual.

6. Consequently such change in the lymph supply is demanded as to exclude a mixed infection.

7. Vaccination confers immunity from smallpox, but not from other (1) synchronous or mixed, or from (2) secondary infections.

8. These secondary contact infections are avoidable.

9. Hence antiseptic methods applied (1) to the present vaccine supply, and (2) to vaccination, will make accidents of vaccination a thing of the past.

10. To procure which end it is desirable, if not necessary, to establish government vaccine stations.—*No. Amer. Pract.*

## SURGERY.

### Ravogli (A.) on Syphilitic Plaques.

During the last six years Dr. Ravogli has treated 216 cases of syphilis. Of these 116 were early syphilis (secondary stage); 94 late syphilis (tertiary stage); and 6 congenital.

Of the 116 cases of early syphilis mucous plaques were found in 103 cases. Of the late cases (94) mucous plaques were found in 24 cases.

Sex seems to have no influence, although many authors claim that they more frequently affect women.

The frequency with which the different anatomical regions are affected is shown in the following table:

In the secondary period—

| | |
|---|---|
| Lips | 38 |
| Anus | 11 |
| Tongue | 11 |
| Vulvu labia, majora and minora | 12 |
| Mouth | 6 |
| Tonsils and palate | 5 |
| Scrotum | 5 |
| Thighs, int. fold | 4 |

| | |
|---|---|
| Præputium and glands | 3 |
| Larynx (vocal cords) | 2 |
| Pharynx | 1 |
| Hand (interdigital) | 1 |
| Foot, between the toes | 2 |
| Under the breast | 1 |
| Axilla | 1 |
| Face | 1 |

In the tertiary period, plaques appeared on the—

| | |
|---|---|
| Palate | 6 |
| Tongue | 6 |
| Nostrils | 5 |
| Conca auriculæ | 2 |
| Lips | 2 |
| Scrotum | 2 |
| Anus | 2 |

### The Treatment of Vulvar Vegetations by Pure Carbolic Acid.

Derville, of Lille (*Jour. de Med. et de Chir. Pratiques,*) treated a case of vulvar vegetations covering both the anus and the vulva, and reaching the size of a man's fist. He cured this enormous growth by local washing with pure carbolic acid. The whole surface of the vegetations was painted with the pure acid; this application was repeated about every fourth or eighth day. The treatment occasioned no pain, but frequently caused erythema, vesiculation, and excoriation of the surrounding parts. This is prevented by the application of vaseline to the healthy skin.—*Therap. Gaz.*

## GYNECOLOGY.

### Premature Sexual Development in Relation Specially to Ovarian Tumors, with an Illustrative Case of Ovarian Sarcoma in a Child of Seven; Laparotomy; Recovery.

The patient, a girl of seven years, was suffering from a large abdominal tumor. Previous to March she presented no abnormal symptoms, when she was raped by a boy on several occasions. Immediately there was a profuse hemorrhagic discharge from the vagina, which continued almost uninterruptedly until she was admitted to the hospital seven months later. Shortly after the rape the abdomen began to swell, until on her admission she had a tumor about the size of a seven months' pregnancy.

However, this tumor proved to be an ovarian sarcoma, weighing over six pounds. Laparotomy was done, the tumor removed and the child made an uninterrupted recovery.—*Ex.*

## ARMY AND NAVY.

U. S. ARMY, FROM DECEMBER 3, 1893, TO DECEMBER 9, 1893.

1st Leiutenant Allen M. Smith, Assistant Surgeon, granted leave of absence for four months, to take effect on or about January 4, 1894.

The leave of absence granted Major Peter J. A. Cleary, Surgeon, on Surgeon's Certificate of disability, is extended four months on Surgeon's certificate of disability, on condition that he report in person to the commanding officer, Army and Navy General Hospital, Hot Springs Ark, on or before December 11, 1893, for treatment therein.

Leave of absence until February 22, 1894, is granted Major John Brooke, Surgeon U. S. Army.

1st Leiut. Benjamin L. TenEyck, Assistant Surgeon, is assigned to station at Fort McIntosh, Texas, for field duty in the Department of Texas.

By direction of the President, the retirement from active service, this date, December 4, 1893, by operation of law of Colonel Charles Page, Assistant Surgeon General, under the provisions of the act of Congress, approved June 30, 1882, is announced.

1st Leiut. Charles Wilcox, Assistant Surgeon, will be relieved from temporary duty, at Angel Island, California, on the arrival there of Major Benjamin F. Pope, Surgeon, and will report in person to the commanding officer, Boise Barracks, Idaho.

1st Leiut. Francis A. Winter, Assistant Surgeon U. S. Army, is relieved from further duty at Fort Wingate, New Mexico, and from temporary duty at Fort Bayard, New Mexico, and will proceed to New Fort Bliss, Texas, and report in person to the commanding officer for duty at that station.

## NEWS AND MISCELLANY.

### Reduced Rates for the Holidays.

In pursuance of its liberal policy, the Baltimore and Ohio Railroad Company announces that excursion tickets will be sold between all stations on its lines east of the Ohio River during the Christmas and New Year holidays at reduced rates. The tickets will be sold for all trains December 23, 24, 25, 30, 31 and January 1, and will be valid for the return journey on all trains until January 3 inclusive.

### Through Cars to New Orleans.

Among the many important improvements in the Baltimore and Ohio Railroad train service is the addition of through pullman Sleeping Cars from New York to New Orleans, via Philadelphia, Baltimore, Washington, and the famous Shenandoah Valley route, passing through Roanoke, Knoxville, Chattanooga and Birmingham. The train leaves New York daily at 5.00 P. M.; Philadelphia, 12th and Market Sts., 7.22 P. M and 24th and Chestnut Sts. 7.38 P. M., reaching Roanoke at 7.50 A. M.; Knoxville, 3.52 P. M., and New Orleans, 12.45 P. M.

This train is very handsomely appointed, being vestibuted throughout, and has Dining Car service New York to Chattanooga. At Washington a Pullman Sleeping Car, which runs through to Memphis, is added to the train.

Galenical Preparations

MANUFACTURED BY

WILLIAM R. WARNER & CO.

MANUFACTURERS OF SOLUBLE COATED PILLS.

FOUNDED 1856

Standard and Officinal Preparations for Physicians Only.

PIL. PHOSPHORUS, DAMIANA ET NUC VOM.

(Warner & Co.)

℞ Ext. Damianæ, 2 grs. Phosphorus, 1-100 gr.
Ext. Nuc. Vom. ⅜ gr.

Med. prop.—Aphrodisiac. Dose, 1 to 2 pills.

Of this combination it has been said: "It re-illumes the fading spark and revives the vital forces."

PER 100, 90 CTS.

PIL. ALOIN, BELLADONNA AND STRYCHNINE.

(Warner & Co.)

℞ Aloin.....1-5 gr. | Medical properties—
Strychnine.....1-60 gr. | Tonic, Laxative.
Ext. Belladonna..⅛ gr. | Dose, 1 to 2 pills

Try this Pill in Habitual Constipation.

PER 100, 90 CTS.

Pil. Sumbul Comp.

(Warner & Co.)

DR. GOODELL.

℞ Ext. Sumbul . . 1 gr. | Ferri Sulph. Ext. . . 1 gr.
Asafœtida . . . 2 gr. | Ac. Arsenious . . 1-40 gr.

"I use this pill for nervous and hysterical women who need building up." This pill is used with advantage in neurasthenic conditions in conjunction with Warner & Co.'s Bromo-Soda, one or two pills taken three times a day. PER 100, $1.00.

Pil. Lady Webster.

(Warner & Co.)

℞ Pulv. Aloes . . 2 gr. | Pulv. Rose leaves . ½ gr.
" Mastich . ½ gr. | M. Ft. one pill.

This is an excellent combination officinally designated as Aloes and Mastich, U. S. P. We take very great pleasure in asking physicians to prescribe them more liberally, as they are very excellent as an aperient for persons of full habit or gouty tendency when taken in doses of one pill after dinner. PER 100, 25 CTS.

BY ALL DRUGGISTS OR BY MAIL.

## HOW TO FEED THE VERY SICK

Every physician is puzzled at times. Such food demands:

1. The minimum of bulk with the maximum of nutriment.
2. Easy digestibility.
3. Prompt assimilation. The problem is solved by

## RUDISCH'S BEEF PEPTONE

(SARCO PEPTONES)

It remains on the stomach when all other food is rejected.
It contains all the nutrition of the finest beef in a pre-digested, palatable and soluble form.
Equally good in hot or cold water for children or adults.
Great strength in small doses.

## ORIGINAL ARTICLES.

### VOLVULUS.

F. BYRON ROBINSON, M. D.,* Chicago, Ill.

Volvulus signifies the twisting of a loop of bowel around its mesenteric axis. Also two loops of bowel could twist around each other.

Sixty per cent. of volvulus occurs at the sigmoid flexure; thirty per cent. occurs at the cecum and ten per cent. occurs in the small intestine.

The cause of volvulus is—(*a*), an elongated mesentery, (*b*), a fatless mesentery, and (*c*), constipation.

Volvulus occurs in males four times as often as in females. This is a curious fact as females are generally more constipated than males. But I suggest that the mesentery of females is longer than that of males.

Volvulus constitutes about $\frac{1}{25}$, or 4 per cent., of all intestinal obstruction. The average age at which it occurs is 50 years—a time when constipation is prevalent and the mesentery is most elongated and fatless.

I have performed many experiments on dogs and human cadavers, and on the intestines of other animals, in order to learn how a volvulus was produced. The first experiments were done on dogs. The abdomen was opened and loops of intestine were drawn out and twisted on the mesenteric axis. The volvulus would always untwist if it was not sutured. After considerable trial, even with the twisted bowel fixed in place by sutures passed through the mesentery, I could not keep a volvulus in its original twist in the living dog. If I wound the omentum around the twisted loop, the dog having recovered in a couple of days, on killing him the volvulus was found untwisted. In one large dog I opened the abdomen, drew out a loop of bowel, twisted it around its mesenteric axis four times and sutured it to the mesentery and omentum. In two weeks after the operation I killed the dog, the volvulus was found reduced but, in reducing, the volvulus had formed two omental bands, one $2\frac{1}{2}$ inches, the other 6 inches long. These bands had been formed out of the omentum as the volvulus had unrolled. They would serve for traps to strangulate the bowel. Other bands also formed but were mostly absorbed. In human cadavers with elongated mesenteries we have forced the feces into the sigmoid with an elongated mesentary. Now if further attempt would be made to force fluid through the sigmoid, the weight of the feces seemed to aid in the tightening of the bowel and obstructing the passage. There is no doubt that volvulus is retained and made worse by some sigmoids having mesenteries allowing masses of feces to get into the middle of the loop and by its very weight, when, the sigmoid was twisted, make it unable to regain its normal position. The intestines of calves were experimented on to produce a volvulus but not much light was thrownon the matter. Calves intestines are very long and so coiled on the mesenteric edge so that it looked at first as if one could be made by injecting water. But

*Prof. Gynecology in Post Graduate School.

the peculiar mechanism of the mesenteric attachment to the intestines always allows the bowel loops to escape being caught.

Volvulus in a human being generally comes on suddenly without any previous history. Its first appearance is accompanied by *pain.* The *pain* is not so severe as in complete sudden constriction of the bowel. It is generally periodic until the twist completely obstructs the bowel. Complete bowel obstruction gives rise to constant pain. The more suddenly he volvulus occurs the more violent is the ain. The pain is generally local and referred. The referred pain is near the umbilicus or abdominal brain. Opium quiets the peristalsis and masks the symptoms.

Vomiting is not so conspicuous a feature as in sudden complete obstruction, but it occurs in various degrees in most of the cases. Tympanites is one of the peculiar features of volvulus. The abdomen becomes rapidly distended and drum-like. The tympanites is due to a reflex paralysis. The irritation from the seat of the volvulus is carried to the abdominal brain by way of the inferior mesenteric plexus (from the sigmoid) when it is reorganized and sent out to all the digestive tract. The irritation on reaching the gut wall paralyzes the plexus and thus renders the gut wall flaccid. The irritation then proceeds to the next plexus just under the mucous membrane, known as Meissner's plexus. This plexus controls secretion. The irritation deranges the plexus so that it secretes excessively, deficiently or disproportionately. The deranged secretion induces fermentation which ends in the production of gases. Thus, according to my views, is explained the enormous tympanites in volvulus. A certain degree of irritation, not too severely infective, is what causes tympanites by reflex paralysis. If there be too much infection, as suppurative peritonitis, no tympanites occurs. The abdomen is flat.

The *shock* of volvulus depends on the amount of nerve traumatism. The effect of shock is by means of the sympathetic nerve centers—especially the abdominal brain. The objective symptoms are a profound, grave and violent change in the vascular system. The red blood leaves the surface. The effect will depend on (a), the individual constitution (b), on the amount of visceral nerve traumatism and (c), on the suddenness of the attack. The main idea is the amount of damage inflicted on the peritoneal and visceral nerves.

Volvulus is a rapid and dangerous affection. It frequently kills, if not relieved, in six days. We do not possess sufficient knowledge at present to assert that a volvulus once formed, ever reduces itself. In fact, many cases of volvulus on being formed have a kind of spiral spring, which aids in retaining them and prevents untwisting. It is very difficult to diagnose volvulus without exploration, but its indications are amply sufficient to do laparotomy. Constipation is absolute from the beginning. In operating for volvulus, the hand should first be passed to the sigmoid flexure, as 60 per cent. occur there. It should then pass to the cecum, as 30 per cent. occur there. If the volvulus is difficult to unwind, it should be so sutured to the abdominal wall that it cannot recur. If it cannot be reduced at all (as has happened) one should anastomose the gut above to that below the volvulus with the author's segmental rubber plates or with Murphy's button.

In autopsies of humans I have found volvulus of the cecum, but was unable to say whether it was sufficient to disturb normal life or not. Very brilliant results may be gained by early laparotomy in volvulus, but left alone it is nearly always fatal.

---

**Passed With Honors.**

Examining Medical Professor—Now, sir, tell me how you would treat a case of typhoid fever.

Student—Well, sir, I should first—I should first—I—

E. M. P. (impatiently)—Yes, yes; go on.

Student (seized with a brilliant idea)—I should first call you in for consultation.

Passes with honors.—*Tid-Bits.*

---

"The paths of pain are thine. Go forth
With patience, trust, and hope;
The sufferings of a sin-sick earth
Shall give thee ample scope.
Beside the unveiled mysteries
Of life and death go stand,
With guarded lip and reverent eyes,
And pure of heart and hand."

—*Whittier.*

# CLINICAL LECTURES.

## SPONTANEOUS EPISTAXIS.

CARL SEILER, M. D.,† Philadelphia.

Spontaneous epistaxis is perhaps, one of the most annoying ailments that the practitioner of medicine is called upon to treat, because, as a rule, it occurs during the night when the patient is most easily alarmed at a copious flow of blood from the nose, and sends for the doctor without giving him information as to what he may prepare himself for. I speak from experience, as I have been called out of bed many and many a night on such an errand. I have in times past tried the different methods mentioned in the well-worn text-books, such as plugging the nasal chambers, both anteriorily and posteriorly, with anything at hand, bed feathers, rags, sponges, and what not, only to find that the patient, although the flow of blood was stopped for the time being, was uncomfortable, and that the epistaxis recurred with renewed vigor as soon as the plugs were removed. Shortly before the late Dr. Agnew, our venerable Nestor of Surgery in this country, died, he told me that he had found a piece of ham fat to be one of the best, if not the best material, with which to arrest nasal hemorrhage, and reasoning from the pathological condition producing the hemorrhage, unlike cotton or feathers or linen rags are materials which, owing to their filamentous constitution allow the new-formed vessels of granular tissue to entwine themselves in their fibres, and on removal of the plugs a portion of these newly-formed capillaries are torn off and, consequently, bleeding starts afresh. The ham fat, on the other hand, exerts an even pressure, allows the granular tissue to form, but presents no crevices or attachments for the embryonic capillaries, so that on its removal the bleeding is not likely to immediately ensue. This reasoning borne of an intimate knowledge of histology, pathology and of a minute anatomy of the nasal chambers led me to search for the origin and original cause of idiopathic epistaxis, and my researches proved that spontaneous nose-bleeding is invariably caused by an abrasion of the mucous membrane of the septum, which causes an accumulation and drying up of the natural nasal secretion so that a scab of dried mucous covers the abraded spot under whose protection the natural process of repair goes on in the form of granulation of tissue, and the new formation of healthy mucous membrane with its epithelial covering.

If now this protecting scab is prematurely removed by scratching or too forcible blowing of the nose the capillaries of this granulating tissue not as yet having attained maturity or protection by epithelium pours out the blood which is supplied to them by the arteriols.

Having theoretically arrived at this conclusion as to the cause of spontaneous epistaxis I reasoned further and the theory arrived at is, that the immature or embryonic capillaries of granulating tissue having no muscular walls, and being as they are, mere channels without limiting walls between the masses of granulation cells have not the power to contract and, therefore, if opened, bleed, which was proved by experience, for I found in a large number of cases that the simple scooping away of the granulating tissue at the seat of the abrasion, until arteriols and capillaries were reached stopped all further hemorrhage, and the subsequent application to the spot of a strong solution of nitrate of silver (2 drachms to the ounce) formed a sufficiently strong and adherent covering to allow the full development of healthy mucous membrane to cover the original abrasion.

It is, however, no easy matter, in fact impossible to detect this granulating tissue in one or the other of the anterior nasal cavities while the flow of blood goes on, and obscures everything within the cavity so that it is necessary as a preliminary step to check the flow of blood.

As stated above I found Dr. Agnew's ham fat superior to anything I had used before but this material is not always at hand when wanted, and I substituted for it a substance known as spunk which is made of the fungi which grow like shelves on beech and maple trees and is used in

†Lecturer on Diseases of the Throat and Nose, University of Pennsylvania.

this country mostly by dentists as the best absorbant of moisture, for drying cavities of teeth before filling. Even that although far superior to ham fat, owing to the fact that when saturated with any fluid such as blood it swells to thrice its size, thereby exerting pressure and does not present the porous surface for the entanglement of the newly-formed capillaries just like the ham fat has the great disadvantage common to all plugs that it fills up the nasal chamber into which it is introduced, allows the blood to flow backward into the posterior asal cavity and around forward through the other nasal chamber so that this also must be plugged up tight and both plugs have to remain until the surgeon can again visit his patient and remove them.

To avoid this difficulty and annoying waste of time on the part of the surgeon I have for the last few years employed a wire clamp, which is nothing more or less than a patent clothes-pin made of wire, slightly modified to suit the purpose for which it is to be used, and of which the accompaning cut gives a fair representation.

This *epistaxis clamp* is nothing but a piece of wire, moderately stout, twisted at its upper end into a ring which gives the necessary pressure to the extremities by its spring. The shanks of the clamp are bent in such a fashion that they separate near the ring, but come close together at their elbows, which latter are furnished with metal plates for the purpose of preventing the sharp point of the elbow from producing unnecessary pain when applied. Immediately below these plates the shanks are bent outward at a sharp angle for the purpose of giving the necessary hold to the finger of the surgeon applying the instrument. When this instrument is to be used the bleeding spot should be determined as nearly as possible. A pad of absorbent cotton, covered by a bandage or strip of muslin or other material should be placed over the bridge of the nose below the nasal bone like a saddle is placed on a horse, and the clamp adjusted in such a way over the pad or saddle that by its spring action it presses the alæ of the nose against the cartilapinous portion of the septum on either side thus effectually and completely closing the external opening of the anterior nasal cavities. If then a backward flow into the posterior nasal cavity takes place all that is necessary to stop this is to enjoin the patient to lay on his stomach and hang his head over the edge of the bed until the blood has coagulated and formed a sufficiently consistent clot to act as a plug posteriorly. Of course he should also be told not to "hawk" because that action of the soft palate loosens the clot, and he should be told to simply spit out the blood as it flows down on the back of the tongue which it must do if he maintains the above described position.

Perhaps one of the greatest advantages of this little device is that the patient himself can remove the anterior nasal obstruction as it is produced from without, and cleanse the one anterior nasal chamber, thus enjoying the comfort of nasal respiration. If, however, he in his distress should have been tempted to remove the clamp before the blood clot on the bleeding side has attained the necessary consistency to stop the bleeding of the embryonic capillaries by its pressure and the epistaxis recurs he or his nurse can easily reapply the clamp.

After the lapse of from fifteen to twenty-four hours the clot may be removed by gently drawing it out with a pair of forceps and the abrasion can be seen after the anterior nasal cavity has been properly illuminated. It is usually the case that we find a little oozing from the spot and it is by means of this that the surgeon is enabled accurately to locate it. All that is necessary then is to scrape away the granulation tissue until the matured arteriols are reached which having sufficient contractile power in their muscular coats to close their lumen and thus stop the oozing, and the subsequent application by means of a cotton wad or camel's hair brush to the abrasion of the above mentioned nitrate of silver solution to prevent any further recurrence of the nasal hemorrhage. Of course this method is applicable only in those cases of ordinary idiopathic epistaxis, but will not answer in those cases which depend either upon the systematic disease such as phthisis, tuberculosis, lupus and typhoid fever, or in which the hemorrhage is caused by nasal polypi, or finally in the rare examples of hæmophelia.

# COMMUNICATIONS.

## MULTIPLE CYSTOMAS OF THE LIVER TREATED BY INCISION AND EVACUTION.*

JOHN B. ROBERTS, A. M., M. D., PHILADELPHIA.

A German woman, fifty-six years of age, was admitted to the Woman's Hospital on October 2, 1893. For ten years she had noticed a swelling, in the right side of the abdomen below the ribs, which for about one year had been somewhat painful. She had always been a healthy woman and had borne seven children. The menopause had been established ten years previous to her admission. One week before entering the hospital she began to suffer with dyspnœa and cough, accompanied by constipation and fever.

Physical exploration of the chest by the hospital physicians showed some dulness over the bases of both lungs posteriorly, with prolongation of expiration and some mucous râles. The vesicular murmur was high-pitched over portions of the dull area. The heart's action was rapid and excited. The pulse was 76, the temperature 101.8°. The frequency of the respiration, however, were not recorded; but breathing was rapid and labored. The pulse was somewhat intermittent and was irregular in rate. In the abdomen was discovered a large mass occupying the greater part of the right hypochondriac and lumbar regions. The tumor was irregular in outline and near the middle line presented a particularly marked elevation, which was elastic on pressure, and gave the examiner the impression that it was a cyst. Percussion dulness was found in the right flank, tympanitic resonance in the left; but there was bulging in both regions. The intestines seemed to be pushed to the left side of the abdomen and were distended with gas. The urine was acid, of a dark color, and had a specific gravity of 1020. Its chemical and microscopical examination was negative. The woman was not jaundiced, and her bowels were moved freely after the administration of Epsom salt and an enema. There was no bulging in the vault of the vagina and the mass in the upper abdomen was not palpable by vaginal touch.

Under treatment directed to the pulmonary condition the cough improved, the mucous râles nearly disappeared and the expectoration became free. The patient, however, still found it difficult to lie flat upon her back, and usually was propped up in bed to make her respiration more easy. I repeatedly examined the woman during the first three weeks of her stay in the hospital, and became quite convinced that the tumor was a cystic growth involving the liver, and that portion of her dyspnœa was the result of upward pressure of the abdominal mass. This opinion was concurred in by Dr. F. P. Henry and Dr. Anna M. Fullerton.

On October 20th I made an incision some four inches long in the median line, extending from a point near the ensiform cartilage downward to one a little below the umbilicus. The incision uncovered that protuberant portion of the tumor which was conspicuous before operation was undertaken. This was evidently a cyst occupying the right lobe of the liver immediately below and to the right of the suspensory ligament. I discovered, by inserting my hand into the peritoneal cavity, that both the right and the left lobes of the liver, as far as I could feel, were occupied by numerous cysts, varying in size from an inch to four inches in diameter. The liver, by reason of these cysted growths, was enormously enlarged and the suspensory ligament extended almost to the umbilicus because of the growth upward and forward of the upper surface of the liver. I could feel the gall-bladder beneath the enlarged right lobe, and by palpatation discovered that it contained an irregular calculus. There was a little ascitic fluid in the peritoneal cavity. The cysts seemed not to communicate with each other but to develop independently throughout the substance of the organ.

The prominent cyst over which the incision was made was stitched to the parietal peritoneum by a continuous suture, because I believed that it was wise to de-

*Read before the Philadelphia Academy of Surgery, 1893.

lay its puncture until adhesion has taken place with the anterior abdominal wall. At the left side of the cyst above, the sutures were carried through the tissues of the suspensory ligament of the liver instead of being inserted into the cyst-wall proper. This procedure left an opening in the belly wall, occupied by the surface of the cyst, about three inches long and two inches wide. The lower part of the incision was closed by three interrupted silk sutures, so that the peritoneal cavity at this point might be kept closed. A dry antiseptic dressing was applied, and the patient was put to bed and treated as other cases of abdominal section are managed.

The diminution of intra-abdominal pressure produced by the escape of abdominal fluid and by the bulging forward permitted by the operation gave considerable relief to the dyspnœa. The contour of the abdomen somewhat changed and the outlines of the tumor were better defined on the left side. The patient was now able to lie down. Some clear serous fluid escaped from the upper portion of the opening where the liver was stitched to the belly wall. This coagulated from boiling and possibly came from the peritoneal cavity, not from any puncture in the cyst made by the needle. I was rather uncertain, however, as to the exact source of this leaking.

On October 27th I laid open the cyst without giving the patient ether. As I was about to begin operation her coughing and straining caused the ejection of a jet of serum from one of the suture punctures in the abdominal wound close to the umbilicus. This was evidence that there was some peritoneal dropsy and that the intra-abdominal tension due to the growth was great. The uncovered surface of the cyst was coated with a layer of plastic lymph of a yellow color.

A puncture was made with a trocar into the wall of the cyst and several ounces of clear fluid escaped. Into the cyst cavity thus emptied were projecting one or two distended cysts three-quarters of an inch to an inch in diameter. These were punctured and gave exit to limpid fluid. Directly behind the large cyst first opened appeared to be a second cyst. This I punctured with a knife and evacuated several ounces of fluid. I thought I detected with my finger fluctuation of a similar cyst behind the second cavity, though I could scarcely touch the posterior wall of this second cyst with my finger introduced through the first cyst and through the orifice between the two cysts. The sense of fluctuation was so similar to that given by the cystic tumors already punctured that I finally thrust a long trocar into the posterior wall of the second cyst. This operation was done, of course, in the dark.

Nothing but fluid blood escaped, and it is, therefore, probable that I punctured healthy liver tissue. The oozing continued while I was occupied in other steps of the operation, and was finally controlled, after a number of cysts had been emptied, by scooping out the clots and packing the deep cyst with iodoform gauze. Altogether I must have evacuated the contents of about three large cysts and five or six smaller ones, puncturing them with a knife thrust in various directions through the intervening cavities that had been laid open. The fluid in all of them was limpid. On the left wall of and within the first cyst opened was one of the cysts growing inward, already mentioned. When I punctured this with a knife I heard a whistling noise as though air had escaped from it. No fluid appeared to be in it, and at first I thought I must have opened the intestine, Careful exploration, however, with my finger showed the cyst to be empty and to have no perceptible opening in its wall except that made by the knife and through which I had introduced my finger. It seems impossible to believe that this contained gas only. A careful investigation of its interior with my finger failed to disprove this supposition. I am forced to believe that it was filled with gas but cannot understand the occurence. It was so deep that I could make no examination with the eye.

After some eight or ten cysts of various sizes had been opened by incising the wall between them, I cut away the anterior wall of the first cyst, making the opening into it correspond very nearly with the aperture into the parietes of the abdomen. This excision opened the peritoneal cavity at the upper and left portion of the wound where the suspensory ligament of the liver was attached to the left side of the abdominal incision. It will be remembered that at the first operation the suspensory ligament was seen and stitched to the belly wall in order to assist in shutting off

the surface of the liver from the peritoneal cavity at the seat of proposed secondary operation. The opening into the peritoneal cavity, made by the unexpected cutting through the suspensory ligament, was closed by a continuous silk suture. I then excised for examination a portion of the tissue which constituted the walls of several contiguous cysts in the bottom of the deep cavity in the liver made by evacuating the several cysts. An active venous hemorrhage occurred from a vein which was opened by cutting through the inter-cystic wall at a place where it was rather thick. The bleeding vein was compressed with pedicle forceps and afterward surrounded by two silk sutures carried through the tissue in a circular manner by a needle. This manœurve stopped the bleeding. The irregular cavities left by the evacuation of the cysts' contents were thoroughly washed with hot water and the whole space packed with iodoform gauze. A separate piece of gauze was pushed firmly into the deep cyst, which was being filled as previously detailed with blood from the wound in the liver behind. The patient showed comparatively little shock during the operation, reacted promptly, and has been for ten days in a satisfactory condition. She can lie flat upon her back, the respiration has been much less impeded, and no evidence of sepsis or peritonitis have occurred. The packing was not removed until the ninth day, and a new gauze packing was then adjusted loosely. Twelve hours later a secondary bleeding occured from the deep cyst, and iodoform gauze was again *tightly* packed into it. The fluid removed from one of the cysts was examined microscopically for echinococcus hooklets, but none were found. Chemical examination showed it to be albuminous—a condition opposed to the theory of the case being one of multiple hydatid cyst. The amount of serous fluid evacuated from the cyst opened was difficult to estimate, as the blood from the deep wound of the liver became mixed with the cystic contents. The fluid and blood together measured two quarts.

I have made only a hasty search of the literature of hepatic cysts; but have not been able to find as yet a case resembling this except one reported by Hayward.[1] His patient was a girl, six and a half years, who died after operation for multiple small cysts apparently connected with the anterior surface of the liver.

Cases of cystic degeneration of the liver and similar disease of the kidneys in the same patient have been observed and reported by Bristowe, Chantrenil, Courbis, Gayraud, Lataste, Pye Smith, Leboucher, Wilks, and perhaps others. The London Pathological Society's *Transactions* contain some interesting discussions on the subject. The cases whose reports I have thus far seen seem to differ materially from the case reported. Most of them seem to have been instances of very small cystic tumors, or more like a true cystic degeneration. Victor Leblond,[2] in his recent work says that serous cysts of the liver, that is, non-parasitic cysts, are very rare, that there existence is denied by some authors, that they are small and difficult to recognize and are apt to be associated with polycystic kidney. Mayo-Robson gives in his article on "Surgery of the Liver and Gall-bladder,"[3] an interesting account of cysts of the liver.

In my case here reported the condition of the kidney is unknown, for the patient is still living and apparently is convalescent. The cysts, however, certainly contained serous fluid and are quite large.

Further Note.—The patient seemed to be slowly convalescing, when a large bedsore formed over the sacrum, notwithstanding the fact that she had been kept on a water bed since before the operation. The temperature was somewhat elevated, but not markedly so. On November 11th, three weeks after operation, she died suddenly and unexpectedly.

Autopsy Notes.—Cyst wall found to be firmly united to abdominal wall at edges of wound, as approximated at time of operation. Extensive adhesions of the peritoneum found over the entire lateral and posterior surfaces of the liver.

The liver itself was greatly enlarged, weighing 11½ pounds, and was riddled throughout by cysts. One large cyst, opened post mortem, in the right lobe of the liver was found to contain about a pint of yellowish pus-like fluid. The solid portions of the liver resembled the

2 Diagnostic et Traitement des Abces au foie (1893), p. 62.

3 *British Med. Journal*, April 15, 1893, p. 787.

condition called "nutmeg liver." A stone was felt in the neck of the gall-bladder, and the gall-bladder itself was greatly attenuated as a result of the pressure induced by development of the cysts. The spleen was somewhat enlarged and contained a whitish spot of softened tissue resembling a gummatous tumor. This was incised for examination. Both kidneys were greatly enlarged and riddled with cysts. The uterus and ovaries were found atrophied and non-adherent.

The pleural cavity of the right side was full of serous fluid. The base of the right lung posteriorly was completely consolidated. The left lung showed small areas of consolidation at its base and posteriorly, but was for the most part crepitant. There was no fluid in the pericardial sac.

The heart was pale, very soft and flabby and of normal size. The right ventricle was completely filled by a soft chicken-fat clot. The left ventricle was similarly occupied by a clot which extended into the aorta. Valves were perfect.

## CLEFT OF THE HARD AND SOFT PALATES.*

J. EWING MEARS, M. D., PHILADELPHIA.

An experience extending over a period of twenty-five years, in which time I have treated by operative procedures upward of one hundred cases of deformities of the palate, has afforded me an opportunity to study the conditions involved, the measures for relief, and the value of the results obtained. The cases under treatment have included all forms, I believe, of congenital and acquired cleft—deformity limited to the soft palate, partial and complete in its extent; of the hard palate—partial and complete, including involvement of intermaxillary bone, and the upper lip, with either single or double cleft. With regard to the cleft of the soft palate, I have observed that in nearly all cases of complete cleft there has coexisted a cleft in the hard palate, implicating to a slight extent the horizontal plates of the palate bone. I soon learned that this condition had an important relation to the success obtained in effecting closures, and I shall refer to it when discussing operative measures.

Of acquired cleft I have met with various forms—from simple perforation, by a small opening, to almost entire obliteration of the soft and hard palates, with destruction of portion of the osseous structures of the nasal cavities. In one instance there was not only a fissure in the median line, but the lateral portions were united by firm adhesion to the posterior walls of the pharynx.

In congenital cleft of the hard palate I have met with instances in which the fissure being bilateral there has been more or less deficiency of the vomer, and in other cases the fissure being limited largely to one side, the vomer, somewhat deflected has been found in articulation with the side less involved, thus permitting communication between one nasal fossa and the ora cavity only.

In the study of the cases under treatment I have been interested in arriving at satisfactory conclusions as to the causes concerned in the production of the deformity, and to what extent hereditation and maternal impressions take part. During the summer of 1876 a lady from the far West came to my office for consultation. As soon as she addressed me I thought I recognized by the nasal articulation and guttural tone of voice, a cleft of the palate, and remarked: "I know why you have come to me for consultation; you have a cleft palate." She replied: "I have not, but I have the articulation of one having a cleft palate, and I have come to you for relief." On examination I found there existed a marked shortening and rigidity of the soft palate which prevented its contact with the posterior wall of the pharynx and thus led to the production of the nasal tone of voice. By division of the tensor palati and the palato-glossi and pharyngei muscles I relieved the tense condition of the velum and secured its elevation so that it approached quite nearly in contact with the posterior wall or the pharynx and very materially improved the articulation. The patient had recently married. A few years after

* Read before Phila. Academy of Surgery.

she brought to me her first-born child, which had a complete cleft of the soft, with partial cleft of the hard palate, upon whom I operated with good success.

A man, upward of fifty years, consulted me for cleft of the soft palate, the result of diptheritic inflammation when a child. His mother dying during his childhood, his father married a second time, and he was a victim of a step-mother's jeers, as well as of her cruelty, on account of his unfortunate condition. Daily she would imitate his tone of voice. Her first child by the victim's father had cleft of the palate. Other instances I have met with in which the mother attributed the condition in the child to having conversed with a person who suffered with cleft palate, etc.

Whatever casual effect hereditation and maternal impressions may have, the observations made in the Dublin Zoological Gardens some years since in the case of lion whelps, have quite positively determined that the condition may be due to a want of proper nutrition in the mother during the period of gestation. Up to the time referred to it had been impossible for the authorities in charge of the garden to rear the young of the lion on account of the universal occurrence of cleft of the palate, which prevented the taking of nourishment to maintain life. The plan of giving to the mother during pregnancy ground bone and food containing the inorganic elements of bone was crowned with success, and within the past years a large revenue has been derived from the sale, to all parts of the world, of lions raised in this garden. The lion whelps in the Zoological Garden in this city have suffered in the same manner, and I have suggested to the superintendent to adopt the plan practiced in the Dublin Garden. During our conversation he stated an interesting fact, that the whelps of lions in traveling menageries did not suffer as those born of mothers confined in gardens, and he was disposed to account for the fact by the rough life led by them, as well as by the variety in the food, consisting of bones as well as of meat—sometimes more of the former than of the latter.

The conclusions which may be drawn from the consideration of the above observation are to the effect that the fissures are due to a want of coalescence of the palatal processes and embryonic tissues during embryonic life, the absence of which union is not due to an infolding or reduplication of the membranes, but to a positive non-development caused by want of proper nutrition. Coalescence cannot take place because the parts are not in approximation.

The conditions presented by persons the subject of cleft palate, are defective articulation, defective deglutition, and, as a rule, more or less chronic inflammation of the nasal and pharyngeal spaces. These conditions vary in degree in accord with the extent of the lesion, but I have observed as great an involvement of articulation where a slight notch only existed in the uvula as where both soft and hard palates have been fissured. The important function of the velum is, by its approximation to the posterior wall of the pharynx, to shut off the cavity of the mouth from the cavity of the nose, so as to prevent the passage of sounds and of food into the latter during articulation and deglutition. The muscles of the velum control by their action the opening and closing of the posterior nasal apertures, as those connected with the nasal cartileges regulate the opening and closing of the anterior nasal apertures. In cases of palate fissure in adults I have observed the use made by the anterior muscles in the effort to do the duty of the velum in so narrowing or contracting the anterior nasal openings as to prevent the escape of sounds or food. The chronic inflammation which exists in cases, as a rule, of extensive fissure, is due to the exposure of the parts to the effect of the air which comes directly in contact with the surfaces without passing through the recesses of the normal nasal fossæ.

The object to be accomplished by treatment is to close the clefts. This can be done either by the adaptation of artificial appliances—obturators—or by operative procedures—staphylorrhaphy, when upon the soft palate; uranoplasty, when upon the hard palate. Since the introduction of these methods each has had its period of employment. Discouraged by the failures to obtain perfect results by operation artificial appliances came into vogue and were employed to the exclusion of operative measures. These failing to satisfy the requirements and especially failing to give comfort to the patient, lost favor and a revival of operative methods has oc-

curred. In my experience I have never found the use of the obturator in cleft of the soft palate satisfactory. In cleft of the hard palate alone I have frequently advised its employment, where the rudimentary palatal processes have been so narrow as to forbid operation, or where the openining was not very large. In some cases in adults of cleft of soft and hard palates, I have closed the soft palate by operation and had adapted to the opening in the hard palate an obturator. In children, I always advise closure by operation.

I have operated at various periods of life—from three years to fifty. I advise operation at an early age in order that the growth of the parts may be facilitated, and that the education of the child may receive proper attention. In children and young persons, especially in females, I use an anæsthetic agent—a mixture of chloroform one part to ether two parts; the patient is placed or held in a sitting or semi-recumbent position. The mouth is held open by a gag which I devised and which has proved satisfactory, easy to introduce, readily held in place, and one which can be quickly removed. In paring the edges of the cleft I secure as large a raw surface as possible in order that the union may be strong. I have tried many forms of needles and varieties of sutures, and I have found the simplest the best. The instrument employed consists of a handle to which needles of various curves can be securely fastened. Silver-wire sutures of medium size are used, a strong linen thread, double, being first deposited and the wire suture hooked into the loop and drawn through; the suture is deposited on one side at a time. The needle is introduced some distance from the edge so as to include a sufficient amount of the tissue to hold the edges firmly in apposition without tension. When the sutures are all in position the edges are brought together and the muscles divided which may be neccessary to relieve all tension. The tensor palati is divided near to the hamular process, and the plato-glossi and plato-pharyngei as low down as they can be reached. In my later operations I have removed the sutures earlier, beginning on the fifth or sixth day to remove those affording the least support and completing removal by the seventh day. This plan has given better results. Liquid food, milk chiefly, is administered by a spoon, whilst the sutures are in position. The patient gradually returns to the use of solid food.

In operations upon the hard palate the method of Sir William Ferguson has been latterly employed, having failed by other methods to secure good results. The steps of the operation consist in freshening the edges, depositing the sutures through openings made with the drill in the bony processes, division of the processes by the chisel or saw, drawing of the segments thus formed to the middle line, and securing them in place by twisting or shotting the wire. The section of the bone should be made so as to avoid wounding the vessels and nerves which come into the oral cavity through the posterior palatine canals, and which line in a groove at the base of the alveolar process. Division of the soft palate downward is necessary to bring the segments in position without undue tension. The cavities formed by the transplantation of the segments are plugged with iodoform gauze, 5 per cent., which affords support and controls hemorrhage. On the third day the plug is removed, and as the spaces close they are gradually reduced in size.

*End-results. As to operative procedures on the soft palate.* If careful examination has been made to detect slight notch in the hard palate and the bone has been divided, union in entire extent has occurred. In cases of long uvuals non-union has sometimes occurred at the very end; if the length permits, cut off.

*As to the hard palate.* In certain cases slight necrosis of portions of the segments, caused by splintering at the time of section, has occurred and the pieces removed. This has not interfered with the reparative process. In one instance the space on one side, left after drawing segments to the median line, was so large that it did not close completely—an obturator was successfully adapted.

*As to the restoration of function.* In all cases of deglutition has been markedly improved, rendered perfect except in a few instances of short and rigid vela in which hasty and careless efforts at swallowing are accompanied by the passage, especially of liquids, into the nasal cavities.

The improvement in articulation has

varied greatly and the improvement has depended largely upon the size and conformation of the faucial and pharyngeal spaces. In a few it has been complete. I can recall at this time a lad who had complete cleft of palate, alveolar process, and upper lip. In infancy the cleft of the lip was closed by Professor S. D. Gross. At the age of twelve I closed the palate cleft, and in his case articulation was so perfect that no variation from the normal could be detected. A lady, twenty-eight years of age, had cleft complete of the soft with partial cleft of the hard palate. After operation she became a salaried member of a church choir, her voice being entirely free from nasal tone. In many the improvement is partial but progressive, especially in children where pains are taken to educate them properly. In some cases where I have been able to retain charge of the patient I have rendered assistance, as growth took place, by subsequent division of the palate muscles, thus increasing the movement of the velum.

In all caees, children and adults, the effect upon the *morale* has been good, and for this reason, if no other, the operation is justified.

## TUMORS OF THE PERIPHERAL NERVES; WITH THE REPORT OF A CASE OF SARCOMA OF THE SCIATIC.

THOMAS S. K. MORTON, M.D.*

All tumors growing in or upon peripheral nerve trunks have come to be classed as neuromata, and of these two general divisions are made—the true and the false. The true neuroma is composed of nerve elements, while a false neuroma is a tumor developing in connection with a nerve or its sheath, but not composed of nerve elements. Virchow has proposed that only true nerve-tissue growths be called neuroma, while other tumors growing in connection with nerves shall receive the same name as would similar neoplasms occurring elsewhere. This more simple and accurate method of classification has not, however, been followed generally by writers.

Fibroma is the common tumor found in connection with nerve trunks, and is usually composed of white fibrous material with few connective-tissue cells. Plexiform and multiple neuromata are usually congenital and often hereditary, slowly growing varities where a number of nerves undergo a fibrinous change and occasionally form plexes of sensitive interlacing cords. The subcutaneous terminal extremities of sensory nerves may undergo fibrous changes and form the so-called "tubercle dolorosa." According to Bowlby[1] sarcoma is next in order of frequency. "They may belong to the round, oval, or spindle-celled varieties. In such growths especially in those which increase very rapidly in size, degeneration cysts may form so that the tumor may become partly filled with fluid. The contents of such cysts are usually blood and broken-down cells." Very rarely myxomas are met with. In these the mucoid material grows from the nerve sheath. Glioma, as may also be said of syhiloma, is all but unknown, excepting upon the cranial nerves, and even upon these is almost never observed beyond the confines of the cranium. Two cases of simple cyst containing clear fluid, in connection with nerve trunks have been reported by Bowlby. I have found references to cases upon record as fibro-sarcoma, myxo-sarcoma, and cavernous sarcoma; also to "blood-cyst" of nerve trunks. The two latter, in the light of modern pathology, probably being instances of cystic degeneration of simple sarcoma. All nerve tumors show a marked tendency to malignant degeneration. Secondary or metastatic tumors of nerves are probably not uncommon. Probably more records of tumor of the optic nerve than all others put together are to be found in medical literature, but nerve-trunk tumors must be considered as rarities when judged by the very small number that I have been able to find reference to in the books and *Index Medicus*.

Diagnosis, before operation, except in

* Professor of Surgery in the Philadelphia Polyclinic.

1 Injuries and Diseases of Nerves. London, 1892.

the case of superficial neuromata, unless there are marked motor or sensory disturbances, is almost impossible in the majority of cases. Even these symptoms may be simulated by pressure upon the nerve by outside growths. It is a remarkable fact that most tumors of nerves give rise to but trivial changes of sensation, and the conveying and trophic power of the fibres is almost never fully destroyed. When the tumor has actually been exposed by dissection, unless the surgeon is exceedingly careful, a nerve is liable to division or other injury before the true nature of the growth is discovered. Cases are upon record where excellent surgeons have not recognized the nature of tumors until the ensuing paralysis of function and the microscope have solved the problem.

Removal of these neoplasms which involve all of the bundles necessitates total division of the nerve trunk above and below the tumor; which should be followed, if possible, my immediate approximation of the ends by the employment of some one of the various methods of suturing, lengthening, or splicing and the subsequent placing of the parts by posture in that position which gives greatest relaxation to the nerve trunk involved. Where approximation is impracticable the ends should be "aimed" at each other by chromic catgut sutures, and regeneration with more or less restoration of function may be expected to slowly supervene in many cases. When the growth involves simply the sheath of a nerve, either internally or externally, prompt recognition of its nature and relations, together with careful dissection, will prevent injury to the nerve itself. If the tumor is within the sheath—as in my case—a longitudinal division of the sheath without division of any of the nerve fibres will be sufficient to fully expose it. If then it is found to arise from a few of the nerve bundles these may be divided and the growth shelled out of its bed, if possible, without rupturing the capsule if it possesses one. Any small number of fibres that may be thus divided may be expected to regenerate and coalesce; larger bundles should at once be sutured with catgut. Subsequent suture of the divided sheath would appear to be a neat point of technique, but as proved in the case here reported, is sometimes unneccesary. On the other hand, the possibility of hemorrhage taking place within a tightly sutured sheath must not be lost sight of. Gowers is authority for the statement that excision of nerves on account of tumor is prone to be followed by the development of bulbar (traumatic) neuromata. This may have been true of nerve sections prior to the antiseptic period, but absence of suppuration, combined as it often can be, with immediate suture should render such results here, as elsewhere, very unusual.

The history of the case which has suggested these remarks is as follows:

Mrs. D. A., aged forty-two years, a Russian of the middle class, entered the Polyclinic Hospital October 3, 1893, with a tumor upon the back of the left thigh. Family history negative so far as could be secured. Physical examination, excepting the tumor, negative. Urine normal.

She stated that about one year previously she had accidentally discovered a small nodule deeply situated upon the posterior portion of the left thigh; that it had grown slowly at first, but during the past three months with increasing rapidity; and that, excepting inconvenience in sitting upon the mass which gave rise to some pain, the tumor had caused little or no discomfort. No definite history of any sensory or motor disturbance in the sciatic distribution could be elicited.

The growth was the shape and size of a large goose egg, with its long axis corresponding to that of the thigh. It lay exactly over the course of the great sciatic nerve, midway between the tuberosity of the ischium and the flexure of the knee-joint. It could be moved somewhat from side to side, but almost none at all upward or downward. It did not move when the posterior muscles of the thigh were exerted. To pressure and palpation the growth was almost insensitive. It felt like a soft fibroma or fibro lipoma, but did not impart any sense of fluctuation.

On October 6th a careful dissection was made and the tumor exposed at the base of a six-inch incision. It was noted that each time the growth was impinged upon by the finger or an instrument, the lower leg gave a sharp, convulsive start. When moderately cleared of its surroundings, the fact that a neoplasm involving the sciatic nerve was to be dealt with was made very evident by observation that the fibres of nerve could be seen as glistening white

cords of varying size, beautifully frayed or spread out as they ran around the growth through the encapsulating nerve sheath. A vertical incision, avoiding nerve fibres, was made to the full extent of the tumefaction through this apparent capsule, when it was further discovered that the tumor proper was entirely disconnected with the sheath, and was separately enclosed in a capsule within. The growth was readily separated from the sheath of the nerve in all directions except at points at the extreme proximal and distal extremities, where a few nerve fibres entered and emerged from it respectively. Some small blood vessels appeared to accompany the strands of nerve substance into the tumor. These fibres having been divided, the growth was lifted out without further difficulty. Upon examining the cavity in the nerve sheath from which it came, it was observed that most of the bundles of the sciatic were in advance of and had been spread out over the external surface of the growth, but that no appreciable injury had been done them with the exception of the few fibres which had necessarily been divided as they entered the tumor. No sutures were applied to the nerve sheath, nor were any ligatures called for. The wound was closed without drainage by alternate deep and superficial silk sutures and a pad of dressing so applied as to make compression upon the cavity left by the tumor. The operation was followed for two days by some pain in the sciatic distribution, but especially in the region supplied by the external popliteal, but no loss of power ensued. All pain disappeared in forty-eight hours, however, and afterward she had no disagreeable sensations. Upon the seventh day all sutures were removed and absolute primary union throughout was found. On the tenth day she began to walk about, and four days later walked home, apparently as well as ever. Up to this date she has so continued.

The tumor was ovoid in shape, four inches in length and seven in circumference where thickest. At either extremity a few nerve fibres and blood vessels appeared to enter or take their exit. Otherwise there were neither adhesions nor pedicle. The growth was encapsulated with a tough brownish-colored membrane, which brought away small granular portions of the tumor when forcibly separated from it by peeling. The neoplasm proper was of a yellowish-brown color, rather dry, and cut like fibro-fatty tissue. Exactly in the centre of the mass was a cavity, not definitely separated from the growth, which contained about half an ounce of bloody fluid. Most unfortunately, during the preparation of the specimen for further study it was accidently destroyed, so that I have not the satisfaction of adding to my clinical and gross pathological diagnosis of sarcoma that of microscopical confirmation. However, the details of several cases almost identical with this in every way, which I append, where sarcoma was proved by the only accurate method, will, I trust, be found to justify me in classing this case as one of that dread malady.

From the scant literature of peripheral nerve tumors I have abstracted the following cases, which are of great additional interest from the evidence which some of them afford relative to the remarkable regenerative powers of nerves, even when great lengths have been removed with tumors and suture has been omitted or found impossible.

Hume[1] reports the case of a man, aged twenty-four, who presented himself with a tumor on the back of the left thigh, which he had observed for five months. It extended from the fold of the buttock to the upper part of the ham, being ovoid in shape and movable from side to side, but not from above downward. There was much pain in the knee and foot, but no loss of motion or sensation. The tumor was easily shelled out with division of the entire nerve above and below. The growth was surroundrd by and incorporated with the strands of the nerve. Besides the main portion of the tumor, the nerve trunk above and below appeared to be infiltrated with the same material, so that it was necessary to remove in all six inches of the sciatic. The cut surface of the growth was of a yellow fatty appearance. There were several hemorrhagic spots in its substance; also others that looked like necrotic or caseating patches. It proved to be sarcoma. The man, soon after operation, was able to walk upon the limb, but there was much wasting and great impairment of sensation. Below the knee palsy of muscles and sensation was complete six months after operation.

1 Lancet, September 19, 1891, p. 654.

A second case, recorded in the same place by Hume, was that of a man, thirty-seven, who had noticed a nodule under the gluteus maximus of the left side four months before coming under observation. He had been subject to molluscum fibrosum from childhood. At the time of operation the growth had attained the size of a "melon." It was found to originate in the great sciatia, the strands of the nerve being stretched over and incorporated with the capsule of the tumor. The small sciatic lay over the tumor and was pushed aside. To remove the growth it was necessary to entirely divide the nerve close to the sciatic notch above and at the border of the gluteus below. By stretching of the nerve ends and extreme flexion of the knee and extension of the hip, all of the upper end of the nerve and one half of the lower extremity were brought together and sutured with strong catgut. In order to lessen strain upon the sutures the patient was made to assume the prone posture, with the hip in extreme extension. The tumor was found to be a round-celled sarcoma. There was primary complete paralysis of the functions of the sciatic. Eighteen months later skin sensibility of the foot was absent, but that above the ankle was almost normal, and there was very little atrophy of the muscles. At this time he presented a large sarcoma of the right chest wall, with pleural effusion, and died five months subsequently. It was then found that he also had a growth in connection with the pleura; nodules in several of the intercostal nerves, the liver, and in the humerus and lung of the opposite side. At the site of operation the sciatic nerve was found at the level of the tuberosity of the ischium to be divided into two portions; the internal of these passed into a nodular swelling, which was continuous upward with the proximal portion of the nerve; the external portion was lost in cicatrical tissue, by which it was attached to the surrounding parts and to the side of the nodule. The whole thickness of the lower end of the central portion was continuous with the nodular swelling. The latter had evidently formed at the line of suture with that portion of the peripheral division of the nerve which it had been possible to bring into contact at the operation. The nodule consisted entirely of nerve tubules and fibrous tissue. There was no local recurrence of sarcoma.

Hume, in the same article, also records the following case: A man, aged forty, had recognized a rapidly growing nodule behind his knee for four months. Upon incision in a large oval, growth of great vascularity was found in connection with the internal popliteal nerve. The short saphenous nerve was stretched over it, thus explaining all pain that the patient had suffered. Three and a half inches of nerve were excised. The ends were not sutured. The man soon returned to his occupation of miner, with paralysis of the popliteal distribution. The growth was encapsulated in the sheath of the nerve and appeared to be defined at each end, but a small number of nerve fibres passed through it. The bulk of the substance of the nerve laid behind the tumor. In its interior one or two cavities filled with blood were found. Six years subsequently the cutaneous sensibility of the leg had returned to the normal, excepting a slight impairment in the centre of the sole, and all muscular movements of the leg and toes were perfect. There was no wasting of the parts whatever.

Little[1] reports the following case: a woman, aged twenty-five, presented a large, firm tumor upon the posterior portion of the thigh above the popliteal space. The first symptoms were dull pains along the thigh and upward. There was no pain in walking, but considerable discomfort in sitting. The tumor pedicle sprang from the sciatic nerve sheath. One inch of the nerve was resected and the ends sutured together. The functional result was almost perfect in a few months. The growth was twelve inches in circumference. It proved to be a sarcoma and probably originated from the neuroglia. There was a true bony centre in the tumor.

McBurney[2] records a case where a man aged twenty-seven presented a growth of six years' development upon the inner side of the right arm. There had been no considerable pain until a month before operation; the pain extended down the arm and pressure was exceedingly painful. It was found to spring from the median nerve in the upper third of the arm; was encapsulated, and when opened, it was

1 Boston Med. and Surg. Journ. December 3, 1885, p. 533.

2 New York Med. Journ., May 1, 1886, p. 504.

seen that the fibres of the nerve spread over the growth. The major portion of the tumor was behind the nerve. The neoplasm and capsule were removed with division of but a few fibres of the nerve which entered it. Microscopic examination proved the tumor to be fibro-sarcoma.

In addition to the above detailed cases I have been able to find the following references to sarcoma of the nerve trunks:

## TWO RECENT CASES OF EXCISION OF THE VERMIFORM APPENDIX FOR CHRONIC RELAPSING APPENDICITIS IN THE INTERVAL.

THOMAS G. MORTON, M.D.*

Joseph H. H., aged twenty-four, has been suffering for eighteen months with occasional attacks of severe pain in the right ileo-cæcal region, with the usual symptoms attending catarrhal appendicitis; the first attack, in the spring of 1891, was a severe one; he was unable to attend to his business for some six weeks; the second lasted only a few days, and subsequently he had four attacks, each more or less marked; the last he had before coming to Philadelphia was particularly severe, indeed very threatening, severe pain, not only local but extending to the bladder, circumscribed swelling and hardness, constipation, irregular chills and fever; recovery protracted.

The patient's condition during the attack was indeed so alarming that it was deemed best he should seek operative relief. Examination disclosed tenderness on pressure and moderate hardness in the appendix region, and with the history an operation was advised, and two days subsequently a lateral section was made; the appendix was found firmly bound down, as was the case with the cæcum, by adhesions; the organ was tied off as was its mesentery; it measured rather more than three inches in length; it was greatly distended near its middle, and the proximal and distal ends were thickened and swollen; a section showed total obstruction of the organs except its middle or distended portion, which was filled with about two drachms of very offensive pus.

No unfavorable symptoms followed, and the patient returned to his home in Clearfield County, on the fourteenth day afterward, and has been quite well since. It is probable that the thinned pus sac would soon have ruptured into the abdominal cavity.

Mr. G. H., aged thirty-four, of Huntingdon, W. Va., has written as follows:

My first attack, on April 25, 1892, was a severe one; sharp pains in the bowels, intestines swelled and became very hard; felt knotted; continuous vomiting. Relief was obtained only through copious rectal injections and bowels moved on third day; able to be out, though very weak, in ten days.

The second attack occurred about the beginning of June, 1892; pains severe, symptoms same as in first attack, though not so intense. Cathartics acted in conjunction with injections, after about eighteen hours; out in five days.

Next attack was in September; same symptoms as in other attacks, not so severe, however, as the former two. Cathartics gave relief without injection; out in five days.

*Senior Surgeon Pennsylvania Hospital.

The fourth attack was in December, was severe, in bed a week; cathartics and injection both used; pain worse than in other attacks.

The fifth attack was in April, 1893; the attack was slight, lasting only three days; same symptoms, no injection used, only salts as a cathartic.

The sixth attack was in July, and the symptoms were mild.

Last attack commenced September 20th; was seized with severe pains in the middle of the night; no relief of bowels for twenty-four hours; semi-unconscious at intervals, but whether from the pain or effects of morphia cannot say. Copious vomiting; injections only used; stomach much distended and very hard. Relief came on second day.

In all the attacks morphia was used to ease the pain, and Rochelle and Epsom salts were the cathartics employed.

Early in September Mr. H. reached Philadelphia, much broken down by the series of attacks, especially the one just recovered from; and feeling satisfied that he could not live through another seizure, and there being no question of the appendix being the source of the trouble, a lateral section was made October 6th; on lifting up the cæcum the appendix was found enormously elongated, or stretched, measuring probably seven inches, its distal end was attached far up to the side of the ascending colon; when this attachment was separated the organ contracted to about four inches; it had a continuous mesentary its entire length, which when tied, the organ was excised.

Convalescence and final recovery was slow; after the operation there was considerable pain, no special temperature, but more or less colic, and great trouble was experienced in getting the bowels to act, calomel was at first given in minute doses, this was followed by salts, and the bowel inaction continued for rather more than two days, when relief followed injections of glycerin; more or less pain at times seemed to indicate that the intestines had not regained their normal position, but gradually the symptoms subsided, but not until the fourth week did the bowels act without injection. The suture points and the surroundings of the abdominal wound for the first few days were more or less inflamed and irritable, but no further trouble was experienced; the distention of the abdomen from flatus probably brought about wound and suture tension and the slight surrounding inflammation.

Mr. H. was about the house at the end of the fourth week, and seems quite well, the bowels acting without assistance.

"*Examination of the Appendix, made by Dr. W. K. Walker, of the Orthopædic Hospital.* The tube, which is 3⅛ inches long, is firm and rigid, so that it can be held by one extremity in the horizontal position without bending in the slightest degree. The vessels of the peritoneal coat are slightly injected.

"The lumen of the tube is narrowed, mucous membrane thickened and found covered throughout with a tenacious mucous.

"Near the distal end of the appendix is found a hardened mass of inspissated mucous and fæces one inch in length and one-sixteenth of an inch in diameter.

"The mucous membrane is everywhere injected, but most markedly at the distal extremity of the tube (for a space of 1¼ inches) in which are seen several punctiform hemorrhages with two of considerable size (about 1-16 by ¼ inch).

"At the point of location of the plug of inspissated mucous and feces are seen two very small necrotic areas (about the size of a pin's head) involving only the mucous membrane, and one of the same size and character, one-half inch from the proximal end of the tube.

"*Microscopical Examination.* A specimen of the mucous placed under the microscope shows an abundance of pus cells with some red blood-corpuscles.

"A section of the tube shows thickening of all the coats, but particularly the mucous, enlarged blood vessels, and in the hemorrhaghic areas, infiltration with red blood-corpuscles."

Of the death rate after operation for appendix excision in the interval between attacks we have no definite information, but recently (October 29th), Dr. W. T. Bull has written, asking for the number of such cases I have operated upon, the number of deaths, and the cause of death; so that we may soon expect to have an estimate of the mortality in this operation; I was only able to furnish Dr. Bull with three cases, all of which recovered; but I am disposed now to consider the operation a more serious one than formerly, for in each instance in

the cases I have had under care, unusual difficulties attended the operation, rendering it protracted, dangerous and difficult. Yet I shall continue to advise the excision of the appendix in all such cases associated with a history of chronic relapsing inflammation, as has been detailed in these two cases just reported, as I think the operation in the interval less dangerous than the risk of perforation of the appendix and with the association of septic peritonitis.

# SOCIETY REPORTS.

## PHILADELPHIA ACADEMY OF SURGERY.

*Meeting, November 6, 1893.*

Dr. W. W. Keen presented a paper on

GASTROSTOMY BY WITZEL'S METHOD FOR PRIMARY CANCER OF THE ŒSOPHAGUS.

(See page 923).

DISCUSSION.

Dr. John B. Deaver: I have been much interested in this satisfactory demonstration. I have performed two gastrostomies, and the difficulty experienced was in preventing leakage. The method which I pursued consisted in exposing the stomach, transfixing the walls and bringing them in contact with the parietal peritoneum, and opening the stomach and introducing a rubber tube or silver canula. I consider the operation described to-night a superior one. In one of my cases an eczematous condition of the skin surrounding the opening was very marked.

Dr. O. H. Allis: I would suggest that if, after taking food, this man put something into his mouth and chewed it, digestion would be facilitated and a great deal of dyspepsia avoided. We are all familiar with the experiments of Beaumont, who, by putting sapid articles in the mouth of the subject, could see the gastric juice poured out. Bearing this in mind, I have in many cases of dyspepsia advised the patient to put something pleasant into the mouth after eating, and chew it for twenty minutes.

Dr. T. S. K. Morton: I wish to add my testimony to the value of the gastrodiaphane in the diagnosis of tumors of the anterior wall of the stomach. The patient first swallows a couple of glasses of water, and the light gives a beautiful red glow over the whole upper portion of the abdomen. In a case of suspected gastric carcinoma which I saw with Dr. Cohen, on either side of the middle line were seen two curious darkenings which at first we thought might be tumors, but which subsequently were found to be the recti muscles. I do not believe that with the light one could diagnose an ulcer or a minor change of structure, but if there were a gross lesion it would be shown. It also outlines the location of the stomach.

Dr. J. Ewing Mears read a paper on

CLEFT OF THE HARD AND SOFT PALATES

(See page 966)

DISCUSSION.

Dr. John B. Roberts: I have been much interested in Dr. Mears' paper. These are the cases in which we want the opinion of an expert, and a man who has seen as many of these cases as Dr. Mears is entitled to the respect that we give to an expert. I have had rather a large number of these cases recently. I see a good many cases in infants at the Woman's Hospital and have been somewhat afraid to attack them. My feeling is that many of these cases are not very satisfactory, and in such young children I have been inclined to postpone operation with the result that many of the cases have not returned. Thrice recently I have operated on hare-lips where there was also cleft palate, operation on which I postponed, feeling that there was not enough bony tissue. I was, therefore, anxious to hear how he manages these cases. The operations on the cleft lip have been somewhat unsatisfactory on account of the cleft alveolus failing to give support to the nose.

In one case I cut through the alveolar process on both sides of the cleft and brought the parts over with a suture as suggested by Wyeth, but that case apparently is not going to do very well. I got the edges closer together, but they did not come in contact. Dr. Bower operated on a similar case using a silk suture, and seems to have gained a great deal. The procedure does not close the palate, but it bring the anterior part together, but of course in these cases no attempt was made to close the posterior gap in either the soft or hard palate. I should be glad to hear what is Dr. Mears' experience in these cases. What does he do where there is cleft palate, with cleft of the lip and of the alveolus?

Dr. W. W. Keen: I am glad to find that Dr. Mears' advocates the operative treatment which, as a rule, is by far the best. In some cases, however, where the cleft has been large I have seen altogether the best results from the use of an obturator, in the form of one made by Dr. Thorington, consisting of soft rubber with a soft rubber and therefore flexible palate.

There is one point on which I would ask Dr. Mears experience and practice. In operating on cleft of the soft palate, I have found no difficulty in securing union, except at one point, and that is where the soft palate joins the hard. The soft palate is very thick from a little above the tip up to near the point where it joins the hard palate. Here it becomes thinner and in some cases almost translucent. In many cases where the rest of the palate has united, there has been left a little opening at this point which I have had to close by a secondary operation or by the use of nitrate of silver or the actual cautery. I should like to know if Dr. Mears has met with the same trouble and how he has overcome it.

Dr. R. H. Harte: Has Dr. Mears tried the operation where one flap is transplanted from one side to the other in complete fissure of the hard and soft palate, and the raw surfaces then drawn together? I think it is known as Davies Colley's method.

Dr. Mears: In reply to Dr. Roberts I desire to say I have operated on cases where there has been a cleft of the palate, cleft of the alveolar process, displacement of the intermaxillary bone, the bone being turned up sometimes at right angles, with cleft of the lip. My practice has been to break down the inter-maxillary bone and bring it in place after freshening the edges and then wiring the parts together. Where this bone has been taken away, as has sometimes been the case, I have divided the process on each side and drawn the detached portions over, approximating them in the centre. I think that is the only method which can be practiced with any prospect of success. I close the hare lip at an early age, sometimes at two weeks, and later the operation on the palate is performed.

I have called attention in the paper to the point to which Dr. Keen has referred. The difficulty he has had I have had in my earlier operations, and I could not account for it until I made a close examination. I then found that just at the line of junction between the horizontal plates of the palate bone, there was a slight notch, and that was sufficient to prevent union at this point. In these cases I cut on each side and draw a segment of bone over, and in this way I have never failed to obtain union at this point.

I tried the operation of transplantation and closure by periosteal flaps in my earlier work. I have never succeeded satisfactorily with these methods, and, therefore, I have later used the method of Ferguson, making sections on each side and drawing the segments over the middle line. Where the alveolar process is very narrow it is difficult to get sufficient bone to close the gap, and if there is necrosis from splintering the reparative process is less likely to go on satisfactorily, but even when necrosis takes place reproduction of bone may occur.

Many surgeons look upon these operations as the *bete noir* of surgery. They do not like to undertake them. I am glad to say there has been a revival of the operation, particularly in Boston. I believe that the adaption of any obturator is unsatisfactory. I have seen the obturator to which Dr. Keen refers, and I have found that patients complain of the discomfort arising from its use where it is applied to the soft palate. Closure of the hard palate by obturator is easily effected. I have not seen either abroad or in this country any obturator which gave the pa-

tient complete comfort, or which I thought as satisfactory as operation which closes the gap.

With regard to the results we all know what they are. I have had some exceptional cases in which the results have been perfect, and I have had a large number in which there has been some improvement, and some in which there has been little or no improvement as regards articulation. I tell patients that a natural tone of voice cannot always be accomplished. This depends a good deal upon the size and form of the pharyngeal and post-nasal space. In some cases the pharynx is very capacious, and when an attempt is made to bring the soft palate in contact with the posterior wall of the pharynx, the space is so great that this cannot be accomplished. In these cases the difficulty in articulation is not entirely removed, and sometimes the difficulty in deglutition is imperfect. In children I have found the greatest benefit derived from the moral effect produced by operation. I think the operation should be done and an effect made to help children suffering from the deformity.

Dr. Keen: I wish to say in regard to the obturator of Dr. Thorington, that although I have not seen it used in many cases, yet where it was used no discomfort was complained of. It has been so excellent that in cases of very large cleft I have rather determined to rely upon it instead of operation.

## CORRESPONDENCE.

### HOW SHALL THE DISPENSARY ABUSE BE REMEDIED?

In a recent issue of the *New York Medical Times* "A plan to remedy the dispensary abuse" is considered.

The writer recommends that a certain number of physicians, who are so disposed, shall divide New York into districts, and that each one shall voluntarily and gratuitously give his attention to the poor deserving sick, both at his office and at their residences. The physician who registers "must promise never to refuse service." The indigent applicants are to have their names so registered that imposition will he prevented; the patients are to have their medicines supplied free through pharmacies, scattered through the city, supervised by the department of Charities and Correction, etc. It is added by this plan instead of a few large clinics we will have several smaller ones.

While appreciating the motives which inspired the writer of the above, yet, it must be said that in a great city like New York, the scheme is utterly impracticable. There is no reason why the general management of the dispensary system should be disturbed, as all that is needed is that the circumstances of every applicant be rigorously investigated.

But, it must not be supposed that the average charitable dispensary is alone responsible for the present wretched state of affairs. The medical colleges and their feeders are the greatest sinners. Clinical material in shoals is what they are looking for, and that they must have come how it will. Some of our teaching institutions have gone into the daily press and clamored for patients "to attend the free clinic on venereal diseases" by Professor So-and-So. Others have given a free lunch at the noon-day hour and have opened on Sundays so that the poor (?) working people could avail themselves of the free treatment. The house-to-house vaccination by the board of health is an iniquitous practice, and is an impudent invasion by the poorly paid city official into the homes of the family physician's patients.

The ambulance system has been greatly overdone of late years in New York. Rich hospitals keep ambulances ready at a moments notice through the telegraph or telephone, to dispatch to the scene of injury—with the result that New York is so stripped of its traumatic surgery that many practitioners will only rarely even see a common fracture.

Now, what shall be the remedy for this state of affairs? That question is easier asked than answered.

Nothing will at all reach the root of the

evil short of drastic measures. First in importance comes *organization*. But, unhappily, of all professions there is none so indifferently united as the medical. Without any stretch of the truth it may be said to-day, that no inconsiderable number of its members subsist through pirating, through a total disregard of all amenities and ethics.

The next measure is *discipline*. But discipline cannot be maintained without a fixed set of rules; or, in other words, a *code*. But codes have become unpopular and a species of Nihilism is rapidly growing in favor.

As a last resort, when all other means fail, then the general practitioners must combine to enforce their demands through such means as special cases require. And in no way can this be more effectively accomplished than through an independent medical *press* and professional opinion. The medical colleges are strongly entrenched behind faculties, which dominate in the manipulation of medical societies and wield a controlling influence in many medical journals. The mammoth dispensaries are strengthened by large endowments, and all with few exceptions are tributaries to the colleges. But the united profession in any city or state, by concerted action can promptly paralyze the most audacious and powerful of them by such methods as will quickly empty their numerous benches. Not by threats and idle vaporings, but by prompt and decisive action. Let the profession prescribe the conditions under which the dispensary patient shall be treated, and watch with a vigilant eye, that they are enforced with rigor. Should any one of these eleemosynary institutions deliberately defy or disregard these restrictions, then there should be no time lost in putting the screws on. Cut off their supplies, withdraw the medical staff or expel from fellowship every member of the profession connected with them. Let this hospital and dispensary building cease, and let those railroad magnates and many millionaires in America, divide their wealth among their poor relations; or with the poor half-starved, destitute, homeless orphan children; among the destitute, helpless aged. But in Heaven's name let them disabuse their minds of the impression that in constructing palatial hospitals, they are in any degree whatever advancing civilization or the interests of an industrious and independent community.

—*Un Avant Courier.*

### Definitions of a Baby.

A London paper offered a prize for the best definition of a baby. The last one of the following took the prize:

"The batchelor's horror, the mother's treasure, and the despotic tryant of the most republican household."

"The morning caller, noonday crawler, and midnight brawler."

"The only precious possession that never excites envy."

"The latest edition of humanity, of which every couple think they possess the finest copy."

"A native of all countries, who speaks the language of none."

"About two inches of coo and wiggle, writhe and scream, filled with suction and testing apparatus for milk, and automatic alarm to regulate supply."

"A quaint little craft called Innocence, and laden with simplicity and love."

"A thing we are expected to kiss and look at as if we enjoyed it."

"A little stranger with a free pass to the heart's best affections."

"That which makes home happier, love stronger, patience greater, hands busier, nights longer, days shorter, purses lighter, clothes shabbier, the past forgotten, the future bright."

"A tiny feather from the wing of love, dropped into the sacred lap of motherhood."—*Medical Brief.*

---

### No False Modesty.

Lady—This is the second time you have received food from me, isn't it?

Tramp—It is, Madame; and you are at liberty to mention the fact to your friends, if you wish.—*Puck.*

---

THERE are now fifty-five towns and cities in England which destroy their garbage and solid refuse by burning, and 570 furnaces are employed for this purpose. In many cases the heat from these furnaces is used to produce steam, and the power is employed in pumping water and running electric light and power plants, and for other purposes.

# THE MEDICAL AND SURGICAL REPORTER

ISSUED EVERY SATURDAY

ADDRESS

Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D.,
Editor.

RODERIC C. PENFIELD,
Publisher.

147-49-51 North Tenth Street,
PHILADELPHIA.

**TERMS**:—Five Dollars a year, strictly in advance, unless otherwise specifically agreed upon. Sent three months on trial for $1.00.

**REMITTANCES** should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

**NOTICE TO CONTRIBUTORS**:—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, DECEMBER 23, 1893.

## EDITORIAL.

### N. B.

Beginning with the new volume, the subscription price of the MEDICAL AND SURGICAL REPORTER will be reduced to three dollars per year. There will be no other radical change. The REPORTER will maintain all of its present distinctive characteristics, and make every effort to further enhance its value to the medical practitioner. In a word, the REPORTER as hitherto sold for five dollars will hereafter be sold for three.

This change has long been under consideration and we believe that the present "tide in the affairs of men" is that "which taken at the flood leads on to fortune." Note the signs of the times: A great and progressive profession is demanding frequent and trustworthy information of all that is doing or making in the medical world, without the necessity of wasting valuable time and needed resources in blasting out what is of value from innumerable and often questionable journals—and there is a stringency in the times that makes every dollar received in cash by the physician appear to be worth two hundred cents. To meet these conditions is a weekly journal of established reputation and success, owning its own plant, buying supplies direct from the manufacturer, saving all profits of middle men, thus largely reducing the cost of production; ambitious to reach every intelligent physician in English-speaking countries; determined that every issue shall contain some thing of present value to every reader of its pages; whose columns are not made up of advertiser's reading notices; which believes that there is so much of value in medical science that it will spare no space for unnecessary professional or personal disputes, nor for the discussion of subjects which are unprofitable unless strictlyscientific; which receives contributions from all sources and makes

due return for such as can be made use of.

No other first-class medical weekly journal has dared such an undertaking. It requires faith to voluntarily surrender two-fifths of one's income and discount the future, but the REPORTER can confidently give reasons for the faith that is within it. The REPORTER is one of the oldest medical weekly journals in America. From its inception it has received a cordial and hearty support from the profession. It has kept faith with its subscribers, and honestly earned the position of influence and authority it now maintains. Forty years ago the REPORTER had few competitors in the field of medical journalism. Now it requires a microscopic search to discover "any long felt want" that can serve as an excuse for a new journal. The very last "need" is now met by the REPORTER—a strictly first-class medical weekly at a price obviously within the reach of every medical practitioner determined to be abreast the times in his profession.

## CONTRA-INDICATIONS AND INDICATIONS FOR SEA-BATHING IN CHILDREN.

Sea baths which produce a remarkable effect in certain children, writes Dr. J. Simon, (*Revue Medicale*, June 25, 1893), are very harmful in others, for example, in rheumatics and in nervous children. When one has employed the sea bath at random in many nervous children from the experience thus obtained formal contraindications may be laid down to their employment. Simon says that it is a mistake to give a cold sea bath to children under two years of age. Of course there are exceptions to this rule, but in general they are very badly impressed by cold water, and, as aged persons, do not react well. The sea bath is also contraindicated in nervous children, those who are called irritable, in children who are incessantly in excitement, in those whose intelligence is continually alert, whose sensibility is exquisite and whose sleep is light. Sea-bathing increases the excitement of such children, diminishes their amount of sleep, and renders them absolutely unbearable. Epileptics, hysterical children, and those with chorea are equally badly influenced by sea-bathing. In such, the crises which have disappeared while far from the sea-coast, invariably return after sea bathing. Sea bathing and bathing in water in the vicinity of the sea are alike sufficient to produce the phenomena of cerebral and spinal excitement in children affected with cerebral sclerosis and paralysis. Rheumatics, with or without cardiac lesions, children subject to torticollis, and to the so-called growing pains ought not to be taken to the sea-shore. Acute and chronic ophthalmia, diseases of the ear, and all of the cutaneous affections are contra-indications to sea-bathing; also pulmonary tuberculosis in its incipiency, and most of the pulmonary diseases and kidney troubles are harmfully influenced by it.

Sea bathing seems to the author to be indicated in certain forms of tuberculosis, notably in the adenopathies, the arthrites, and in Pott's disease. The indication for sea bathing is especially absolute for the subjects of rachitis, who find themselves marvelously benefitted at the sea-shore. It is also advisable to carry to the shore children convalescent from grave diseases, those with anemia and chlorosis. Arrived at the sea-shore the children should rest for from five to six days before commencing the baths; the first bath should be short, not lasting more than a few seconds, and even when they have become accustomed to the bathing they should not remain in the water more than five or six minutes.—D.

# ABSTRACTS.

## THE MORAL IMBECILE.*

DR. I. N. KERLIN, Elwyn, Pa.

An experience of thirty years in the care and training of feeble minded children has brought to my observation a group of cases quite distinct in their symptoms of derangement, and requiring forms of discipline quite unusual as compared with those applicable to the children ordinarily recognized as idiotic. Two of these, studied twenty-five years ago, have been followed by experiences with others, so that now in a population of 740 inmates we differentiate 16 as belonging to this special group and 90 others who merge into it.

Besides these who have been under daily study and discipline, many more have been brought to our knowledge through correspondence,—a correspondence revealing the agony and unrest of as many homes, caused by the baneful and incomprehensible misconduct of certain children in whose interest the most pathetic appeals have been made.

The symptoms marking the diseased lives of these scores of children have been confined either mainly or entirely to aberration of the "moral sense," with either no deterioration of the intellect or, if slight, such as could be considered secondary only. These phenomenal disorders have dated from temper explosions, night terrors, and most remarkable obstinancies observed in infancy and early childhood, or may have originated in a marked and well-remembered febrile attack, associated with some infantile disease and accompanied perhaps with convulsions, or, more rarely, may have followed a markedly nervous and precocious youthhood too suddenly reaching a serious climax at puberty. The fundamental disorder is manifested in derangement of the moral perceptions or emotional nature rather than in the intellectual life, which not infrequently is precocious. Unaccountable and unreasonable frenzies, long periods of sulks, and comfort in sulking; motiveless and persistent lying; thieving, generally without acquisitiveness; a blind and headlong impulse toward arson; delight in cruelty, first toward domestic pets, and later toward helpless or young companions; self-inflicted violence, even to pain and the drawing of blood; occasionally, delight in the sight of blood; habitual wilfulness and defiance, even in the face of certain punishment; a singular tolerance to surgical pain and hebetude or insensiblity under disciplinary inflictions,—these are some of the forms in which the congenial deficiency of the moral sense evidences itself. It is hard to answer, "What is there in all this to distinguish from simple wickedness or badness?" unless the answer is contained in the persistency of the trait and the utter destitution of any reason for it, as is indicated in the confessed helplessness of the child to do differently. As a further aid to the diagnosis, we may refer to the fact that in one class of these cases the conduct is the reverse of what might be expected from the environment in which the child has developed; or, on the other hand, the ancestral and prenatal history of the child is such as to project a strong light for the interpretation of this condition as that of a neurotic inheritance.

Of the several children observed at Elwyn, quite frequently they are of faulty stock, presenting the gravest statistics of inebriety, epilepsy, acknowledged insanity, and in some instances even crime.

During the thirty years' contemplation of the subject, a marked change in professional opinion has been noted, so that it is no longer hazardous to reputation to believe in the existence of a condition termed "moral insanity" nor to refer to it as of commonly congenital origin, and hence better denominated "moral imbecility."

In Germany, both the legal and medical professions accept quite unanimously the doctrines of moral imbecility. The most enlightened minds of England have embraced them, and, many in America are their advocates.

A distinguished judge of Pennsylvania has so far amended his habit of thinking

*Reprinted by request, from the 17th Annual Report of the National Conference of Charities and Correction, held at Baltimore, 1890.

as to agree with an eminent English judge who, "after many years of constant administering of the criminal law, was compelled to admit that, in a large majority of cases brought up for sentence, he himself would have committed the same acts if he had descended from the same stock and been subject to the same surroundings in early life"; and so far has this former gentleman progressed in this, to him, new line of thought as to have added: —

The helpless classes — lunatics, imbeciles, and criminals—all call for our sympathy as well as our care. They are all to a greater or less extent the victims of circumstances from which the more fortunate humanity escape. There is no sharp dividing-line between these three. The ranks run into one another, and the individuals are readily interchangeable from one rank to the others. There is a moral defect in all of them, often also a physical defect. Call it moral insanity, or what we will, it runs throughout all moral imbecility, the helpless classes, and is the main element in their helplessness. Being unable to govern themselves to the extent required by the public good, it is our duty to govern them, and that without unnecessary harshness or cruelty.

Confirming testimony of these views was most abundantly given at the recent Second International Congress of Criminal Anthropology in Paris, at which were assembled distinguished representatives of science, law, medicine, and the administrative world, from France, Italy, Russia, Holland, Belgium, the United States of America, Denmark, Sweden, Roumania, Servia, Brazil, Mexico, Peru, Paraguay, and Hawaii. Sentences were there uttered so replete with originality, and so applicable to the subject we treat, that to quote them, even in the most abridged terseness, will give this paper its best value. Brouardel said: "It has been to the honor of the Italian school, in the land where Roman law, the foundation of all law, was born, that it has again put into the crucible the problem of criminality, and that it has proceeded to the analysis of that problem by the only truly scientific method, by studying the psychology of criminals, and their pathological abnormalities. It will be its distinction to have declared against illusory enthusiasm, and to have founded a science which will contribute to the more efficacious protection of society."

Lombroso, another leader of the Italian school, "summarized what he believed to be the most important abnormal physical characteristics found among criminals,—the presence of cranial and fascial asymmetry, precocious synosteosis, unusual frequency of left-handedness, large orbits, prominence of the zygoma, large median occipital fossa. These characters, he considered, were all due to pathological causes."

Lacassagne pointed out "the too often forgotten factors of misery in the production of crime," but added "that he meant not social misery alone, but physiological misery of which the origin was intra-uterine."

Benedickt, the Russian, with the forcible language born of elaborate examinations of the brains of criminals, "declared the criminal to be a diseased person or a lunatic, in whom we must consider the molecular troubles of the cerebral substance as well as the external signs."

Garofolo, an eminent Neapolitan lawyer, said, "Criminal law must be treated as a detached and isolated science: it must be subordinate to psychology and anthropology, or it will be powerless to interpret and determine, in any enlightened legislation, the true classification of criminals."

M. Ferri summed up an able paper on the "Determining Condition of Crime" with the conclusion "that we must on the one hand ameliorate social conditions for the natural prevention of crime, and on the other hand exercise measures of temporary and perpetual elimination of individuals, according as the biological conditions in each case seem more or less curable."

M. Alimena attached great importance to education, especially its hereditary influence: "The criminal ought not to be able to say to his judge, 'Why have you not made me better?'" He agreed with the words of Lacassagne at the first Congress, "Societies have the criminals they deserve." M. Taverni had made a number of investigations on children in reformatories,—a study which he called pedagogic biology,—and had traced backward the childhood of criminals, and forward the career of unpromising children. The chief indications he had found in the childhood of criminals were inap-

titude to education, resistance of family order, and revolt against social conventionalities. Among adult criminals are found in their childhood the same characteristics of inaptitude and resistance. M. Magnin, with a corresponding large experience, said, "The child is already often a complete criminal, as the result of physical and moral degeneration due to nervous, insane, or alcoholic heredity."

But nearer home we find apt delineations "moral imbecility." Lyman P. Alden of the Rose Orphan Home, Terre Haute, Ind., in his second report, and as his summary of experience covering many years, speaks of a group which he has encountered in his reformatory work, as follows:—

But there is a third class for whom little can ever be done. Congenital and hereditary evil propensities are so powerful that all human agencies are too weak to cope with and arrest them. With now and then an exception, they are the children of degenerate parents, the consequences of whose sins they are now bearing. Not every child of evil parents will be bad, by any means, any more than every child of good parents will become good. But the strong tendency is all that way, as every intelligent, observing superintendent of children's institutions must have observed. These are the children that, in spite of all our efforts to rescue them, will finally go to swell the class of prostitutes, paupers, and habitual criminals. Love, kindness, rewards, encouragements, warnings, entreaties, and punishments are equally ineffective, except as temporary restraints. The vileness and evil that are packed in some of them would be incredible to those who have never become acquainted with this class. What shall be done with them it is hard to say. Sent back to their homes and old associates, their downward course is rapid. To place them with nice families is an imposition on the families, unless they are informed of the facts; and then few would take them. Whenever institutions have sent such children out to homes, they are soon returned, worse than ever. To keep them in the institution endangers the morals of the other children as well as its peace, harmony and good order. But, fortunately, of this hopeless class there is not a large number, less than five per cent.; and, if at last they fail to become good citizens, it cannot be charged against society that they never had any chance.

And again, before this body at its meeting in St. Louis, in 1884, Dr. J. D. Scouller described with prolific illustrations this third class of the reformatory population, "as the boys will make our criminals, who will be our law-breakers; the boys who love the world, the flesh, and the devil;" those of whom Solomon says, "You may bray them in a mortar among wheat with a pestle," but you will only damage the wheat. Their souls are as impressionable to gratitude as the granite slab to the rays of the sun. They are always innocent of the crimes charged against them. He correctly says: "They are not all from the criminal ranks. We find on examination that there may be perhaps twenty per cent. from respectable and well-regulated homes, thirty per cent. from the careless, undisciplined, but not necessarily criminal families, and fifty per cent. from the criminal classes of society."

Ladies and gentlemen, if we would come to the conclusion that we have a class of little children whose heredity and aberrations are such as to make them the predestined inmates of our insane hospitals and jails, what an advance we would make in the diminution of crime and lunacy by a methodized registration and training of such children, or, these failing, by their early and entire withdrawal from the community!

Instead of so much interest being centered about the seventy-five per cent. who are discharged annually from your refuges, alleged to be reformed and fit for society, a no less interest would be discharged on the black residuum of 25 per cent. who are also discharged, to be as yet unaccounted for in the statistics of refermatory work, but, pariah-like to add a contribution of evil to society which will shadow, if not eclipse, the accredited value of our whole reformatory work.

Cannot an almost unerring decision be made by the trained and humane experts of our asylums, jails, and reformatories, by which the indeterminate sequestration, under the best conditions for their moral and physical welfare, shall be the practice of those who are congenitally unfit to mingle their lives and blood with the general community?

The various Ladies' Aid Socioties of

the country, the associations for the protection of children from cruelty, and many other organized charities, are all working in the right direction, in gathering out from unfit and barbarous homes the ill-bred and misbred nervous children of coarse and brutal stock; for it is now quite recognizable that a drunken or criminal parentage is not fit to rear its ill-gotten progeny. But it is less recognizable that a fussy parentage is ill qualified, too, for the training of its nervous oversensitive, and spoiled progeny. The societies referred to are doing their utmost primarily to domicile unfortunate children in private and considerate homes, and, unsuccessful in this, to endow our foster homes, refuges, and institutions for the defective with a liberal clientage. It is only a step farther to analyze this heterogenous mass into "curable" and "incurables," and to restrain the undue haste in thrusting the incurable out upon a world for which they are utterly unfit, where they poison and contaminate as many more, and, after taxing society with their prolific and indiscreet reproduction, are drifted at last into poorhouses, jails, and hospitals of the commonwealth.

The practical thought I have to offer from this is: let us recognize "congenital moral imbecility" as a terrible fact.

Let us accept this moral imbecility as the incurable infirmity of an irresponsible victim, to whom, as the piteous cross-bearer of the sins of society, we owe kindly nursing and protection against himself by a grateful and total withdrawal from the community, which, in its turn, has a right to demand that he shall not scathe our common stock with permanent taint in blood and *morale.*

Let us widen our thought so as to include under the great generic class of imbecility not only the accepted physical and intellectual forms, which are now so obvious, but also this sadder and more dangerous group, which, neglected and misunderstood because of our ignorance or hardness, is sapping our mental and moral vitality.

And, as a further practical suggestion, I wish to add that any general State institution for the care of the feeble-minded should embrace a department for the care of the *moral imbeciles.* They can be indentured to work. They can, so far as their stolid natures will permit, be best drawn into sympathetic relations by contact with helpless idiocy, and be made to contribute toward its nourishment. They need not necessarily be taught to read and write; for the school, as ordinarily kept, contributes to their deterioration. Intellectual entertainment for these people is best provided in the exercises of the shop, the field, and garden. They take aptly to theatricals, base ball, cornet, orchestral and vocal music; and these, with kindred amusements, should be the indulgences granted for good behavior and for the uplifting and general "good of all." I trust there are some—yes. many—in this Conference who may see in these suggestions a line which followed will lead to the relief of many of our institutions, to a better understanding of this worst form of moral perversion, and to a partial arrest of the apparently increasing degradation of our race.

---

CHILDREN should be trained to eat slowly, no matter how hungry or what important business is pressing. Much safer a little food well ground than a hearty meal swallowed in haste. Cold food is even more difficult to digest than hot, if taken too rapidly. The normal temperature of the stomach is about ninety-eight degrees; food has to be raised to this temperature before digestion can take place.—*People's Health Journal.*

DR. MARY A. SUGANUMA has been granted permission by the Japanese Government to practice as a physician in Nagasaki. Dr. Suganuma is an American woman who was graduated from a medical college in Ohio. She became a Japanese subject, on her marriage with Mr. Suganuma, a government official in Osaki. Dr. Suganuma is the first woman physician permitted to practice in Japan.

—*Boston Woman's Journal.*

---

I have oft heard people say,
"O wad some power the giftie gie us"—
(Quoting from an old Scottish lay)
"To see oursels as other see us."
But I would far more happy be
If some fairy, witch or elf,
Would make the other people see
Me, just as I see myself.

—*H. Dodge Tichenor, in Life's Calendar.*

## THE THERAPEUTICS OF CROUPOUS PNEUMONIA.

Dr. Larrabee, (*Jour. Amer. Ass.*) says:—In the discussion of the therapeutics of cropous pneumonia, I recognize the importance of tabulating only those means which through a long period of time have proven valuable in the hands of the writers. The value of papers of this kind, is in direct proportion to the truthfulness of the statement therein contained, and to the careful clinical observation and and experience of the author. In treatises designed for text-books, it is quite proper that all the known therapeutics, both practical and speculative, should be compiled, the endorsement of which is not made by the author and little of which has been the result of his experience.

I shall, therefore, make no attempt to enumerate the so-called remedies for this disease, however much extolled by others, nor shall I criticise those which in the experience of others have been valued. I recognize various therapeutic roads leading to the same desired terminus, and I care as little what means may be employed by others equally skilled, as I would to know with what tools a carpenter has completed my house, if he has completed it according to the plans and specifications.

Regarding pneumoniæ crouposæ as an acute, infectious disease, running a definite and limited course with a pronounced tendency to recover by natural processes alone, I might be expected to say very little concerning its therapeutics.

Notwithstanding the fact that medicines are powerless to cut short the disease, and the conviction expressed that very many will recover without any medication, few physicians possess a clientele of sufficient intelligence to risk a trial.

For this reason, as well as to favor the course of nature in repair, I constructed the following prescription some twenty years ago, since which time I have made it the sole treatment from the beginning to the close of the attack.

Moreover, it has been given as a part of my instruction to medical classes for nineteen years, and it is safe to say that at least a thousand practitioners have made it their chief reliance and have so expressed themselves to me by letter or person.

The indications—therapeutical—which are met by their combination are:

1. Satisfaction on the part of friends, that something is being done for the patient.
2. The satisfaction on the part of the practitioner that he is not doing harm to his patient.
3. The promotion of diuresis.
4. The promotion of diaphoresis and increased elimination of carbonic acid with reduction of temperature.
5. Increased alkalinity as shown by urine and a lessening of fibrin in the blood, promoting free mucous secretion and lessening the tendency to coagulation of blood.
6. Gentle, but diffused stimulation of the nerve centers, favoring sleep and preventing spasm.

℞ Spts. eth. nitrosi.
Potassæ. acet. ..... āā—ʒjss
Spts. mindereri .....
Aquæ. camphoræ ..... āā ℥ij

To be left with slightly acid reaction as shown by litmus. M. ft.: Adult, dose, tablespoonful; child, dose, teaspoonful, every two hours.

To this may be added tr. aconit or veratrum if needed, and in convalescence tr. ferri chloridi. Such additions always to be made as extra doses and not a part of the prescription.

Death approaches the sufferer from croupous pneumonia always through the heart. For this reason it is of the utmost importance to watch this organ, from the inception to the close of the disease. With the trained finger upon the pulse and the educated ear over the precordia, we catch the first signal of danger. To be forewarned is to be forearmed. Nothing is more essential to the cardiac therapeutics than a knowledge of the mechanism of heart failure in pneumonia. *Pari passu* with the consolidation of lung and in direct proportion to its extent, we have a mechanical obstruction to the transfer of blood from the right to the left heart, and added thereto the addition of carbonic anesthesia to muscle and frame. This occurs at a time when ptomaines from vegetable diplococcus are in circulation and before the anti-pneumotoxin has been formed in the albumen of the blood. More blood is coming into the right auricle than can be forced through the lung by the ventricular stroke. The right ven-

tricle becomes so distended that the apex beat is completely removed from its original site, between the fifth and sixth ribs, and the ear placed over the heart detects a heavy dull sound, while percussion reveals an increased area of dullness. In this condition the indications for improvement in the circulation become extreme and pressing. How shall this be best accomplished? It is philosophical to attempt relief by a vis-a-tergo, or is it more rational to attempt a vis-a-frontis? Are these the indications for the employment of digitalis? It may be a good plan to goad the tired ox that has fallen in the furrow if you want a little more work, but you will kill the ox. It may be good therapeutics to stimulate a diseased kidney if you want a little more urine, but you will have a little less patient. It may be good practice to give digitalis to a fagged out heart in the stage of hepatization of croupous pneumonia, but I doubt it. Digitalis stimulates a weak heart by contracting the arteries and arterioles, by throwing the blood back upon the heart itself, and where there is no pulmonary obstruction the action is prompt and efficient, as in valvular patulences, etc., but the very condition which is killing the patient in pneumonia would be rendered still more dangerous by such an agent. Our fathers did eat manna in the wilderness and they are dead, but is it strange that venesection should occur to the mind as a possible solution of the question? Experiments in venesection have demonstrated that a heart brought to a standstill in such diastole may be revived by aspirating the right ventricle.

It has been ascertained that even ligation of the lower extremities just sufficient to prevent the return of venous blood, is followed by immediate relief to the heart. In the same manner is the explanation of the sense of relief felt by the patient upon the application of dry cups and hot flaxseed poultice to the chest walls. Pediluvia would also prove of service, were it not for the ever present danger of assuming the erect position.

Notwithstanding it comes to us as a voice from the past, there is to-day much truth in the statement that "blood-letting is good in pneumonia." Bleeding and tartar emetic marked the heroic treatment of the sturdy yoemen of the early nineteenth century, and yet we find from statistics that the mortality for 1822 to 1832 was 10 per cent., while from 1880 to 1890 it was 18 per cent.

Without attempting to revive a therapeutic so long abandoned and so universally condemned, it must be admitted that those old-time doctors struck some underlying principle in therapeutics which we, with all modern accomplishments, have failed to recognize. That principle was the relief of the over-burdened heart. I propose, therefore, to demonstrate how this same desirable end may be obtained without jeopardizing the life of the patient and without inflicting upon him a long and tedious convalescence.

*I.—By agents which determine the blood to the skin.* This may be accomplished by the warm pack, which, applied at a temperature of 98½°F., and protected by light woolens, envelops the body in an atmosphere of steam. By this means the peripheral nerves are soothed and almost invariably this procedure is followed by quiet sleep.

*II.—By belladonna.* This time-honored and faithful servant of materia medica is too often lost sight of in practical therapeutics. It has a place in all hyperpyrexias accompanied by paleness of the skin and in low stages of fever. It is particularly adapted to the condition under consideration, being an indirect stimulant to the heart, diminishing the blood pressure by dilatation of the capillaries. It is also a stimulant to the respiratory centers of the brain, thereby inducing a more perfect æration of the blood. The comparative harmlessness of this remedy in infancy and early childhood enables us to push it quite up to its toxic effects. It has done me yoeman's service in many an apparently hopeless case of threatened cardiac failure in pneumonia.

*III.—Nitro-glycerin and the nitrites* may be expected to rescue a heart after the manner of aspiration, taking off the pressure and flushing the skin, even when brought to a standstill in the diastole of a full right ventricle. Aconit and veratrum viridi certainly have a place in the treatment of pneumonia; the former, being a sedative from the start, is too dangerous for administration by continued dosing; the latter is safer than digitalis. Fothergill's statement that "digitalis is both spur and oats to a heart," is preëminently

true, and in low forms of fever where the adynamia is due to long-continued hyperpyrexia. I have attempted to show that the mechanism of cardiac failure in pneumonia has its foundation in an entirely different pathology. I have been led to these conclusions by clinical observations and not by theory.

Finding that in this disease alone I failed to obtain the usual slowing and filling of the pulse in the radial artery, I began to investigate the cause of the failure of this grand old drug so generally serviceable in crippled hearts.

Alcohol will prove a far better cardiac stimulant in pneumonia, by reason of its power to dilate the capillaries, thereby retaining more blood in the skin, while at the same time it may have some value as a respiratory food.

*IV.—Applications to the chest.* The feeling that something may be accomplished, at least for the comfort of the patient suffering with pneumonia, by local applications to the thorax is universally believed by the laity. No doubt this idea had its origin in individual experience in many painful diseases. Shall they be cold or hot, moist or dry? Heat is a stimulant and cold is a sedative. Heat relieves pain under any and all circumstances. Heat locally applied is a powerful stimulant to the heart, and, by its action upon the vaso-motor nerves, lessens active hyperemia of the brain.

Physiologic experiments made upon the heart of a frog show that pulsations may be restored after a complete cessation by the application to this organ of a bit of cotton wrung out of very hot water, but they are again arrested by the application of cold. I prefer warm to cold applications, although some authorities, particularly Germans, speak favorably of cold, and even ice packs in the treatment of pneumonia. The choice is between poultices and cotton batting, protected by oil silk.

Those of us who have experienced the relief of a congestive headache by a warm foot bath containing mustard, are best prepared to answer this question. Is it probable that the same relief would follow putting the feet in cotton batting instead of hot water? Poultices are rarely properly made and seldom properly applied. Moreover, they are, at best, a very clumsy application, and by adding weight to the chest walls embarrass still further the labored respiration. A towel wrung out of very warm water wrapped once or twice around the chest and neatly covered by oiled silk is a far more elegant and comfortable application.

By this means the entire thorax is surrounded with an atmosphere of equal warmth and moisture, the superficial vessels are dilated, pain is relieved and repair hastened. Stimulating embrocations are also of benefit and are useful in proportion to the chronicity of the case. The following prescription is a favorite of mine:

℞
Ol. succini rectificati..... ʒss
Ol. caryophyli..... mxx.
Liniment saponis..... ʒiiss.
M. ft.

Cough is a constant accompaniment of pneumonia. At first dry, frequent and distressing, it soon succumbs to consolidation of the lungs and returns with commencing resolution. This return is hailed with pleasure by the physician and with unnecessary alarm by the laity. Perhaps it is the latter observation which has led to the employment of expectorant mixtures, most heterogeneous in composition and most therapeutically incompatible in application. These mixtures generally contain the entire list of so-called expectorants in the materia medica. Ipecac and squills to loosen, senega and ammonia to stimulate, wild cherry and other tannates to cheek secretions, alkalies to lessen viscidity of mucus and opium to benumb sensibility. Some of these prescriptions are a pharmaceutical curiosity. Yet one meets with them with such frequency in consultation practice that it would appear that reform in this direction is making slow progress. Such mixtures do little more than destroy the appetite and disgust the patient. Water, given in abundance, and at short intervals, is the best expectorant required. In cases of children, about the time of crisis of pneumonia with restlessness, cold extremities and pinched features I have seen great good from tincture of assafetida with whisky toddy. As a protection to the chest during convalescence a neatly fitting vest made of one layer of carded wool or absorbent cotton quilted and covered by oiled silk should be worn upon the chest.

It is probably the observations of others bedsides myself, that purgatives administered during the stage of hepatization

of a lung are bad. I have so often been called to cases made worse by the officiousness of some grand-dame, whose desire to purge amounts almost to insanity, that I am able to detect such interference by the collapse that has followed. I can give no explanation other than that purgatives add to the general depression at a time when the child is poorly able to stand it. If the bowels need attention they should be moved by simple enematæ.

The enthusiasm for the treatment of high temperature so popular a few years ago, has, in a large measure subsided, and it may now be said that thermometric observations are less liable to plunge us into therapeutic errors than formerly.

I have never participated in this "Don Quixotic" fight of temperature, to the extent of allowing it to control my therapeutics, but have been content to treat hyperpyrexia alone, and always in relation to other existing symptoms.

In catarrhal pneumonia I am guided altogether by respiration ratio; in croupous pneumonia by the pulse ratio as compared with temperature.

It is exceedingly rare that I find a hyperpyrexia which does not yielded to the warm bath or the warm pack, which I greatly prefer, and to the "tubing coils," known as my invention.

Some danger always attends upon the patient suddenly assuming an upright position in pneumonia, on account of the sudden strain placed upon the heart. I have more that once seen an immediately fatal result following such a procedure. Hence the preference of the pack to the bath. As I grow older in the profession and more experienced in practice, I am less courageous in the use of heroic measures. I must confess to a timidity in the use of the socalled antipyretics known as the coal-tar products or derivatives so highly praised by many excellent physicians. Reduction of temperature, however desirable, ought not to be purchased at the expense of de-oxidation of the blood in pneumonia.

CEREBRAL SYMPTOMS.

Previous to the investigations of Sternberg and Frankel and the discovory of the diplococcus or pneumococus of Friedlander, cerebral pneumonia admitted of no rational explanation. Various theories, in themselves ingenious, were made to account for the intense cephalalgia in adults, and for the initatory convulsions of croupous pneumonia in infancy and childhood. It was at one time thought that cerebral manifestations were more frequently associated with apex consolidation and I, myself from observation, was inclined to corroborate this statment.

Prof. J. Lewis Smith recording his own valuable experience during an epidemic of cerebro-spinal meningitis in 1872 in New York city, makes a special mention of the great increase in the number of cases of croupous pneumonia prevailing at the time. He evidently recognizes a pneumonic from cerebro-spinal fever. I have many times witnessed the recession of typical cerebro spinal symptoms *pari passu* with the development of consolidation of the lung. In infancy these cerebral symtoms, marked by convulsions and vomiting, are so common an accompaniment of croupous pneumonia that one is never warranted in pronouncing upon meningitis without a careful examination of the chest. I am convinced that nothing but clinical experience will prevent young practitioners from making this serious error, so completely do the brain symptoms overshadow those of the pneumonia. In etiology, however, they do not differ from the symtoms produced by alkaloidal products of the microorganisms — toxalbumins — in other disease circulating in the blood, e. g., scarlatina, smallpox, measles and typhoid fever.

So soon as the characteristic lesion of these diseases becomes established, these so-called brain symptoms subside as rapidly as they came. With this etiology it is scarcely possible that one will be found administering drastic cathartics or applying leeches to the scalp. Bromids and chloral are also of doubtful propriety.

The warm bath, the warm wet pack to the chest and tubing cap to the head, is almost certainly followed by relief, quite sleep and by reduction of temperature, which is also a factor in disturbances of the nerve centers by no means to be lost sight of in our therapeutics.

So long ago as 1880, in my lectures, I stated that the sudden and remarkable change which occurs usually from the fifth to the seventh day, known as crisis must have some other explanation than the subsidence of inflammation. Auscul-

tation and percussion so frequently revealed no improvement which could reasonably account for such a change; for days after convalesence was established the local lesion could be readily demonstrated.

The study of the micrococcus pneumoniæ crouposæ and its product, pneumotoxin, has led to the discovery of a so-called anti-pneumotoxin, supposed by the celebrated German scientists, the Klemperer Brothers, to be antidotal to the former. The opening of this window certainly throws a flood of light into a dark recess. Should the fond expectations of these earnest investigators prove true, your patience will not be burdened in future by lengthy papers upon the therapeutics of croupous pneumonia.

The sick will be made to cure the sick, and the physician, armed with his hypodermic syringe, will act as a mediator between the two. Unfortunately, however, for all these beautiful theories which comet-like, dart across the medical sky, dazzling our vision, they are soon lost below the horizon, leaving us to "darkle in the trackless void."

In diseases which secure an immunity against a subsequent attack, we have a right to expect much from inoculation. Pneumonia in so far from securing exemption from future attacks, predisposes to them, and this has been the observation of physicians from time immemorial the world over. I have in my practice a patient who has had croupous pneumonia seven times in six years and whose life has been in jeopardy several times.

In conclusion, permit me to say that, while the majority of cases require little medicinal treatment, the successful practitioner will be on the alert to detect constitutional and hereditary weaknesses, in his little patients. The importance which attaches to diathesis can not be over-estimated. Pneumonia in a rachitic infant carries with it a far more grave prognosis than in a healthy child.

The strumous and tubercular diatheses entail a series of consequences peculiar to each. Delayed resolution in the lung and enlargement of the bronchial glands, indicate the use of potassium iodide and muriate of ammonia, with the daily application of tincture of iodin to the upper portion of the thorax.

Cod-liver oil with marshmallow emulsion, and the elixir lacto-peptine with tincture ferri chloridi and gentian have proven to be excellent reconstructive tonics.

---

**Incubation.**

Diphtheria, two to seven days; oftenest two.

Typhoid fever, eight to fourteen days; sometimes twenty-three.

Influenza, one to four days; oftenest three to four.

Measles, seven to eighteen days; oftenest fourteen.

Mumps, two to three weeks; oftenest three weeks.

Rubeola, two to three weeks.

Scarlet fever one to seven days; oftenest two to four.

Small pox, nine to fifteen days; oftenest twelve.

Further investigations were made with regard to the time and duration of the infective period.

Diphtheria was found to be infective during the period of incubation, attack and convalescence.

Mumps and rubeola are also infective for three or four days before the onset of the parotiditis and appearance of the rash.

The contagiousness of measles speedily disappears, and does not continue in disinfected persons for over three weeks.

Typhoid fever is infectious from the time of onset until two weeks after the fever has gone and convalescence set in.

As is well known, the contagiousness of scarlet fever varies greatly, but is generally continued a very long time—certainly until desquamation ceases, and sometimes as long as eight weeks.

Publisher (testily) — I can't see anything in that article of yours.

Author (vindictely)—I suppose not, but you may have some readers who are blessed with common intelligence.

# THE LIBRARY TABLE.

## BOOK REVIEWS.

*A Chapter on Cholera for Lay Readers: History, Symptoms, Prevention and Treatment of the Disease.* By Walter Vought, Ph. B., M.D., Medical Director and Physician-in-Charge of the Fire Island Quarantine Station, Port of New York; Fellow of the New York Academy of Medicine, etc. Illustrated with Colored Plates and Wood-Engravings. In one small 12mo volume, 110 pages. Price, 75 cents net. Philadelphia: The F. A. Davis Co., Publishers, 1914 and 1916 Cherry Street.

This little book, destined to circulate among the laity, is replete with useful information, presented in a readable manner, and if carefully noted will no doubt achieve its purpose, by teaching many in aiding those so unfortunate as to be attacked by the disease, where the much needed element of rapid action often turns the scale in the direction of a life saved.

---

*Recent Developments in Massage, Historical, Physiological, Medical and Surgical.* Douglass Graham, M. D. Physicians Leisure Library. G. S. Davis, Publisher.

The author presents a concise book on the subject of massage, intended, he states, to be a supplement to his Treatise on Massage, issued in 1890. The chapter devoted to the physiological effect on muscle tissue contains useful hints, based upon experiments and experience, showing, that, by its use one can look for an improvement in nutrition, hence it will often counteract the effects of excessive fatigue, as well as prove useful in a great number of affections which are largely dependent upon faulty circulation, nutrition or excretion. There are useful suggestions in the nine chapters devoted to the practical consideration of its application to various diseases.

---

*Cholera—Its Protean Aspects and its Management.* Dr. G. Archie Stockwell, F. Z. S. In two volumes. Physician's Leisure Library. G. S. Davis, Publisher.

The author treats his subject with studious care. He is careful to avoid any enthusiasm which might lead astray from not only scientific study but research into the history of this dreaded scourge. His views upon bacillar pathology are best given in his own words. "The exponents of bacillar pathology depend solely upon hypothetical assumptions, ignoring all forms of evidence not adduced by themselves." "Their pathology is merely an experimental experience admitting of neither negations or offsets, their therapeutics, a form of still hunt with untried weapons, in an unknown jungle, after a hypothetical prey." "Indeed it is a sad travesty upon medical science, when authors and would-be teachers wantonly assert rabies, cholera, yellow-fever, dengue, tetanus, endocarditis, pneumonia, etc., are diseases whose microbic origin is positively known, when two of these are supported only by manifest fraud, in two more the evidence has never been adduced in any form, and in the other three it is of the most flimsy superficial character."

The treatment advocated is one of general stimulation and directed principally to the vagus; the utility of this being shown by reporting certain cases in detail. While the opinions set forth differ in many particulars from those of recent writers, yet they deserve careful reading at the hands of those who desire to learn.

---

*Electro-Therapeutics of Neurasthenia.* W. R. Robinson, M. D. The Physicians Leisure Library. G. S. Davis, Publisher.

The author in this small volume considers the causes of neurasthenia, their classification and how they should be treated by means of electricity which he regards as the true nerve tonic. The dose, if it might so be called, is largely dependent on the susceptibility of the patient and the good judgment of the physician as well.

The author devotes special chapters to the three principal forms of electricity and their uses. He however, feels that there is often a necessity to combine with such treatment, other remedies; also he advises calling in the surgeon if local mischief exists, which is only amenable to the careful and conscientions use of the knife.

### Treatment of Obesity by an Exclusively Nitrogenous Diet and Copious Libations of Water.

Savill and Haid (*Lancet of Pittsburg*) recommend the following treatment for pronounced obseity: The individual is restricted to a purely nitrogenous diet, consisting of one pound of cooked fish and one pound of lean meat per day, and a pint of hot water must be drunk at intervals of two hours. Aside from this, no other article of diet whatever must be taken. The meat and fish may be taken at regular intervals, as suits the case. Five or six pints of water should be taken during the day. The hypothesis on which this treatment rests is that the patient supplies the neeedful hydro-carbons, which are withheld from his diet, thorough absorption from his own body. The ingestion of the large quantities of hot water is likewise supposed to exert a beneficial influence in some unexplained manner. This should be continued even after the patient has returned to ordinary diet, from which, however, potatoes and especially beer are exculed. It is not unlikely that the large quantities of water tend to overcome the renal disturbances which often manifest themselves when an exclusive nitrogenous diet is adopted with the ingestion of the ordinary amount of water only.

# CURRENT LITERATURE REVIEWED.

IN CHARGE OF ELLISTON J. MORRIS, M. D.

THE AMERICAN JOURNAL OF OBSTETRICS for December. Dr. Richard B. Maury contributes a paper on

**The Present Status of our Knowledge of the Pathology of Pelvic Inflammation,**

dealing especially with the treatment of pelvic abscess. The question as to whether cellulitus ever exists pure and simple, unassociated with pelvic peritonitis, he answers in the negative, and emphasizes the statement that suppuration of the cellular tissues of the pelvis is rare as compared with the other forms of pelvic abscess. As the result of his experience he comes to the following conclusions:

1. Pelvic cellulitus is an acute form of disease recognized clinically only in the puerperal woman, or in one who has suffered septic infection after a surgical operation on the genital canal.

2. Chronic cellulitus is a misnomer.

3. The occurrence of cellulitis to the extent of forming appreciable exudations in the pelvis is of infrequent occurrence.

4. Cellulitus to an appreciable degree, clinically, often occurs in connection with peritonitis. It is discoverable, on the cadaver, in the shape of small cicatrices, especially in the neighborhood of the tubes and ovaries, between the layers of the broad ligaments, and in the utero-sacral ligaments, and is associated with evidences of extensive peritoneal lesions.

5. When large exudations form in the cellular tissue the great majority undergo resolution. Suppuration is the exception.

6. Pus collections in the pelvic cellular tissue are seldom seen in comparison with other forms of pelvic abscesses.

He insists that all intra-peritoneal abscesses should be approached through the peritoneal cavity by abdominal section, with a view to enucleation and complete removal of the diseased structures which constitute the pus sac, and which if allowed to remain, are liable to cause a recurrence of pelvic disease. He should depreciate all endeavors to reach these abscesses by extra-peritoneal methods; believing, should the complete and thorough radical removal of the diseased tissue be impracticable or attended with too great risk, that drainage through an abdominal incision is safer and is attended with more complete relief than can be obtained by any vaginal operation.

Dr. Charles P. Noble discusses

**The Relation of Certain Urinary Conditions to Gynecological Surgery.**

He emphasizes especially the following points:

1. The importance of the systematic examination of the urine of gynecological patients, especially of those requiring celiotomy.

2. That the presence of albumin and of casts in the urine need not effect the issue of the operation.

3. That serious and prolonged celiotomies involving much handling of the abdominal viscera, in women having chronic Bright's disease (especially the small contracted kidney), usually terminate fatally.

4. That the prognosis is best when the presence of the albumin and casts in the urine is due to the pressure of an ovarian cyst which can be quickly removed.

The paper includes the report of six cases illustrating the points made by the author.

Dr. Francis Fœrster continues his article the

**Comparative Microscopical Studies of the Ovary,**

the paper in this issue being devoted to the consideration of the result of ovulation in the ovary. He condenses the results of his investigation as follows:

1. Whereas ovulation followed by pregnancy causes the production of a corpus luteum, which the author has shown to be an endothelia, ovulation without pregnancy will never cause the appearance of a corpus luteum or endothelioma.

2. In the cow, the sow, the ewe, and the guinea-pig the burst Graafian follicle, being first filled with blood, will in turn be filled with myxomatous tissue and be enclosed with a structureless layer, possibly the subepithelial follicular membrane.

3. Not infrequently the structureless layer, perhaps because of an infiltration with a elastic or hyaloid basis substance, is very broad, far in excess of the central myxomatous tissue.

4. Broad follicular membrances cannot be unchanged subsepithelial layers, but must be due to a new formation of tissue from the medullary stage to a more or less perfect infiltration with hyaloid basis substance.

5. In the cat's ovary there are no follicular membranes, but, instead of these, broad layers of endothelia enclosing the central myxomatous tissue.

6. After a certain time the follicular membrane, or the layers similar to it, are, by a retrogressive change, transformed into an indifferent or medullary tissue. This change may take place in the whole follicolar membrane or in portions of it.

7. The central myxomatous tissue is likewise transformed to indifferent or medullary tissue.

8. From the medullary tissue, the outcome of both the follicular wall and the central myxomatous tissue, a new type is developed, known by the term of myxofibrous connective tissue.

9. The myxofibrous tissue in alternate portions falls back to the stage of protoplasmic indifference, and at last gives rise to a dense, delicate, cicatricial connective tissue.

10. The cicatricial fibrous connective tissue remains unchanged throughout life, and is the last remnant of a burst follicle. It may contain apparently structureless vestiges o

the follicular membrane or may be entirely destitute of the latter.

The paper is illustrated with wood cuts of sections of ovaries showing the various conditions spoken of by the author.

Dr. James F. W. Ross contributes a paper on

**The Omentum and the Role it Plays in Operative Work upon the Abdomen.**

The paper is largely taken up with a discussion of the functions of the omentum and the author is of the opinion that it in some way regulates the amount of fluid in the peritoneal cavity. He also likens it to a man-of-war, ready to sail to any port in which there is impending trouble, from the readiness with which it attaches itself to an inflamed tube or intestine for the purpose of shutting off any purulent collection from the general peritoneal cavity. The author also suggests that it may hold surplus supply of blood during the process of digestion, and that such blood, not being utilized as it is in other parts of the body, such as muscle and the liver and kidneys, deposit fat so frequently found in the omentum.

The various surgical diseases of the organ are also fully considered in the paper.

Dr. Charles Clifford Barrows discusses the

**Conservative Surgery of the Uterine Appendage.**

The author considers that the Trendelenberg posture has simplified all abdominal work enormously, as by its means we can bring the field of operation into view and by the proper placing of flat sponges or sterilized gauze pads shut off the general peritoneal cavity from any possible infection at the time of operation. Flooding of the cavity of the peritoneum and the use of the drainage tube he considers unnecessary. The author believes that certain cases of pyosalpinx may be successfully treated by amputation of the tube at some distance from the cornu of the uterus, and the formation of an artificial ostium abdominale. In cases of pyosalpinx where the ovary is healthy and the fimbriated end of the tube is not adherent to it, he has amputated the tube at the outer end of the healthy portion of the tube, washed it out, slit it up a short distance, and united its serous and mucous coats by fine catgut sutures thus forming an artificial ostium abdominale.

The author also publishes a table of cases operated on—eighteen cases with no deaths.

[The objection to the Trendelenberg posture in the minds of some operators is the ease with which pus could find its way into the upper part of the abdominal cavity whence it would be difficult to remove it. It is a very significant fact that the most successful operators are in the habit of using the drainage tube and flushing the abdominal cavity in cases where the procedure is warranted by reason of hemorrhage or purulent collections within the pelvis.—Ed.]

Dr. Henry Louis Hayes reports "A Case of Protracted Gestation—Delivery on the Three Hundred and Eighty-ninth Day." The author is of the opinion that these ten grain doses of Quinine were very instrumental in inducing the labor.

Dr. George Wythe Cook discusses the question "Should Marriage be Recommended as a Remedy for Disease in Women?" After reporting a number of cases the author comes to the conclusion that marriage has a tendency to increase the pain of dysmenorrhœa by direct irritation causing excessive hyperæmia, and to aggravate nervous conditions by reflex over stimulation of the nervous system.

The remaining papers in this issue are: "Cavernous Angioma of the Uterus," by Dr. H. J. Bolt; "Report of a Case of Ovarian Tumor Complicated by Encysted Remains of Tubal Gestation on One Side and Calcified Ovary on the Other," by Dr. Marcus Rosenwasser; "A Case of Diffuse Sarcoma of the Mucous Membrane of the Uterus," by Dr. Warren Coleman; and "Poliomyelitis Anterior Acuta Infantilis: Its Ftiology and Treatment," by Dr. Anna M. Galbraith.

---

THE VIRGINIA MEDICAL MONTHLY

for December. Dr. Charles H. Bushong contributes and article on

**Abortion in its Earliest Weeks—Its Treatment.**

Tne author believes that many abortions, particularly where the pregnancy is of only a few weeks, are overlooked and the cessation of the periods attributed to cold or other indiscretions. The possibility of pregnancy should never be overlooked in any case where the patient has missed a week or more over her usual period and then looses an unusual amount of blood. In view of the possible sequences of abortion, its immediate and proper treatment is of the utmost importance. If seen early enough, the first thing to do is to attempt to prevent the abortion and check the tendency to expel the fœtus. This should always be done when possible. When the condition is such that all hope of saving the fœtus has passed, or when the symptoms are dangerous to the mother, everything must be done to expedite its expulsion. For the purpose of preventing the abortion the author advises the use of powdered opium, in pill form, in doses of half a grain to two grains, continued for two or three days in diminishing doses. Where there is considerable hemorrhage and yet reason to believe that the fœtus is living, he advises the use of ergot either with or without hydrastis. He believes the best result will be obtained by the administration of half a minim of the fluid extract of each drug every ten or fifteen minutes for the first few hours. He states that, given in this way, a smaller amount of the drug will be required and there is less liability of the stomach becoming upset. Quinine has, however, been more satisfactory to him than either ergot or hydrastis. It is given in one grain doses of the sulphate every hour until cinchonism is produced or the hemorrhage controlled. Each dose is followed by an

ounce or more of water. Absolute rest is enforced and too frequent examinations of the uterus through the vagina avoided.

If it is decided that the abortion is inevitable the uterus must be emptied of its contents. He rejects the use of the tampon on account of its uncertainty and the danger of pyæmia as the result of retention of some of the fœtal envelopes or the damming back of the blood into the tubes. The patient should be etherized, the cervix dilated if not already sufficiently open, and the contents of the uterus removed by some one of the various forceps made for the purpose. The uterus is then cleansed by means of small pieces of cotton dipped in hot water. Following this, the uterus is swabbed out with carbolic acid diluted one-half with glycerine, and the vagina cleansed thoroughly with cotton dipped in hot water. The patient should remain in bed with light diet for some days. The author finds quinine in five grain doses three times a day useful in puerperal cases. It has replaced ergot entirely in his obstetric practice.

If there is any tendency to pelvic peritonitis, hot vaginal douches must be given. Should the cervix close, an Outerbridge drain is to be introduced. If pelvic peritonitis sets in, it can be allayed by the use of a saturated solution of Epsom salts. Care should be taken to prevent the patient from moving about too soon.

Dr. Russell M. Cunningham presents

**Some Recent Observations of Croupous Pneumonia,**

with special reference to prophylaxis and treatment. The paper contains the results of the observation of ninety-three cases in one of the convict mines in Alabama. The author presents the following as his views in regard to the disease:

1st. It is a constitutional disease, with a local anatomical sign, consisting of an inflammation of the pulmonary parenchyma, and caused by its own specific materies morbi or germ, probably that of Frankel or Friedlander.

2nd. That the special circumstances under which this germ is evolved and operates are unknown, as we have it under diametrically opposite conditions, both good and bad.

3rd. That the disease, as a rule, prevails endemically, rather epidemically, and still more rarely sporadically.

4. That these endemics differ in type and in extent of pulmonary inflammation, and, consequently, in mortality.

5th. That the disease is severer in public institutions, especially prisons.

6th. That the negro is especially predisposed to the disease, has less capacity to resist it, and, consequently; a larger mortality.

7. That coal-miners, especially negroes, while not predisposed to the disease, are favorable subjects for extensive pulmonary inflammation, and have less capacity to resist the disease, owing to the more or less anthracosis of the pulmonary tissue.

8th. That the mortality is mainly determined by the type of the disease; first, in the primary effect of the germ upon the nervous system; and secondly, the extent of pulmonary inflammation and in the rapidity of its invasion and development.

9th. That the mild, uncomplicated cases, with a fairly good pulse and moderate temperature, and with only one lobe, especially a lower lobe, involved, intrinsically tend to recovery; and that the severe cases, complicated or not, with fast and weak pulse, fast or labored respiration, regardless of temperature and attended by great prostration, intrinsically tend towards death, and without judicious treatment will die, regardless of the extent of pulmonary inflammation; and that in the cases in which the pneumonia is double, particularly if the double invasion is simultaneous, their tending is to a fatal issue; and finally, that in the cases in which the inflammation is universal by a simultaneous or rapidly successive invasion of the entire long structure, death is the inevitable rapid result. Therefore, in comparing statistics, all these things should be taken into account, otherwise they are worthless. Hence the wide divergence in the statistics and difference in treatment of various observers.

10th. That the immediate cause of death in many cases is ante-mortem heart clots.

11th. That the main features of treatment are: (a) to combat the shock of the germ invasion, best done by opium, stimulants, and, in my opinion, hypodermoclysis; (b) to stimulate freely, the best stimulant, as a matter of routine, being whiskey and strychnine, supplemented in extreme cases by tincture strophanthus; (c) to control temperature, the best method being the bath; (d) to prevent, if possible, heart clots, hypodermoclysis, in my opinion, being the most reliable; (e) to meet indications as they arise.

---

Dr. Charles G. Cannaday discusses "Chronic Endometritis, its Aetiology, Modern Methods in Diagnosis and Treatment," advocating the use of electricity for the cure of the condition.

The remaining papers in this issue are: "Insanity—Its Relation to the Public and Profession," by Dr. R. J. Preston; "The Law of Virginia as to Right of Physicians to Recover their Fees by Suit," by Samuel D. Davies; "Forensic Medicine," by Dr. C. G. Comegys; "The Human Brain—An Appeal to the General Practitioner to give it More Study," by Dr. J. Harrison Hodges; and "Periodical Inebriety," by Dr. T. D. Crothers.

Under Clinical Reports, Dr. Charles P. McMabb presents "A Case of Brain Injury—Compression—With Slight Symptoms at First—Trephining, Recovery;" and Dr. R. H. Garthright reports a "Case of Maternal Impressions."

---

**Syphilis—Children.**

The joint affections occurring in children suffering from inherited syphilis may be any of those caused by the acquired disease, which Hutchinson enumerates as follows:

"1. Synovitis during secondary stage.

"2. Perisynovial gummata.

"3. Arthritis due to osseous nodes or gummata in the neighborhood of the joint.

"4. True chronic synovitis.

"5. Syphilitic chrondro-arthritis (of Virchow.")—*British Med. Jour.*

# PERISCOPE.

IN CHARGE OF WILLIAM H. BRICKER, M. D., B. SC.

## MEDICINE

### Nayet on Effects of Inoculation in Animals of Human Cancer and Cancerous Products.

1. Carcinomatous tissue from man macerated in glycerine gives a liquid which injected several times into the bodies of white mice is able to develop a neoplasm evidently cancerous.

2. This result is obtained only after a very long period of incubation and is accompanied by a cachexia which develops suddenly only a little while before death. In one case eleven months intervened between the cachexia and the last inoculation.

3. When the production of the neoplasm does not result, the animal succumbs to a tardy cachexia without any anatomical alteration appreciable to the naked eye.

4. This fatal cachexia also results (though a little more slowly) by one injection sufficiently large, of the glycerine extract (prepared from an epithelioma of the stomach) without macroscopical change.

5. The grafts of human cancerous tissue in the white mouse are absorbed without producing any local or general alteration, at least during the six months which the animal generally survives.

6. Where two distinct cancers have been obtained in the same animal, one must admit that they result from the first injections of the cancerous liquid, for it is irrational to suppose that two cancers shown to be contemporaneous by their equal development can produce themselves spontaneously and simultaneously.

Multiple tumors always grow by dissemination of degenerated elements proceeding from the older and more developed neoplastic focus.—*La France Medicale.*

### Prevention of Tuberculosis.

Lawrence F. Flick (*Medical News*) offers a comprehensive scheme of practical measures for the prevention of tuberculosis. 1. Registration of all cases of the disease which have arrived at the breaking down or infectious stage.

2. The education of the public at large and of the people immediately concerned as to the contagious nature of the disease and how to avoid contracting it and how to avoid transmitting it to others.

3. The careful and thorough disinfection of all infected houses, penal and reformatory institution, conveyances and public places.

4. The establishment of special hospitals for the treatment of the poor suffering from the disease.

5. Government inspection and regulation of dairies and slaughter-houses.

6. The enactment of laws and ordinances forbidding practices as a result of which others are liable to be infected.

7. The restriction and regulation of interstate and international emigration of persons suffering from the disease.

8. The retirement of all tuberculous patients in the infectious stage from occupations in which they can infect others and the pensioning of those who cannot be maintained in hospitals.

### Foot and Mouth Disease in Man.

A fatal case of glossitis is recorded by Dr. Rose of Berlin. It occured in a man of 50, who was admitted to the hospital with great œdema of the tongue and albuminuria. Notwithstanding diminution in size of the tongue, death occurred on the fourth day. *Post-mortem* examination revealed no œdema of the glottis nor infarct in the lung. There was venous stasis in the meninges. The liver was icteric and fatty. Cocci were cultivated from the kidney similar to those found by Siegel in foot-and-mouth disease. Dr. Siegel said that the case plainly belonged to the category of diseases of the tongue such as he, the speaker, had repeatedly observed during the last few years, In human foot-and-mouth disease the tongue was always swollen, but he had only observed six cases similar to the one described. Two cases like the one mentioned died with symptoms of general septicæmia; three recovered without any special consequences; one man was the subject of very remarkable changes. Of the tongue only a stump remained, movable with difficulty; the remainder had necrosed and fallen off. In 1891 he had first published a work on cases of human root-and-mouth disease reminding one of scurvy. There were blisters on the tongue, and mucous membrane of the cheeks, lips and nose. The patient couplained of attacks of giddiness, and pain in the stomach and liver. The general appearances were those of a typhoid disease, with low atypical fever of very prolonged duration and high mortality. In a series of necropsies he had always found the same bacterium in all the organs, but especially in the kidneys and liver. Inoculation of animals remained for a long time without any result; but when pigs and calves were inoculated, vesicles appeared on the mouth, declared by experts to be foot-and-mouth disease. The same organisms were found in the organs of these animals. When the disease was conveyed to man, the symptoms would vary greatly with the degree of virulence. He observed an epidemic of the disease in 1892, affecting children and adults in equal proportions. Out of 192 severe cases, 16 died, equal to 8.5 per cent. In May and June of the present year there was a slight outbreak of the disease. In four necropsies the same bacteria was found as in other cases. A peculiar localization of the vesicles was that on the breasts of suckling women

and the prepuces of men and boys. The disease might therefore be mistaken for syphilis. In one case the vesicles formed on the conjunctiva and cornea, with very unfavorable prognosis. The vesicles on the soft palate and tonsils might easily be mistaken for diphtheria. In many cases an exanthem like that of measles or scarlatina was spread over the whole body; in these instances the low temperature was an indication of the nature of the disease. As regarded treatment, salicylate of sodium showed a distinctly specific activity, and the litho-salicylate of sodium produced the same beneficial effects.—*The Med. Press and Circular.*

### Actinomycosis Cured by Potassium Iodide.

Dr. Meunier, communicated to the *Paris Academy of Medicine*, the history of a case of actinomycosis in man, the seventh on record in France, but the first treated and cured by the iodide of potash. The patient was a railroad engineer who had never lived in the country, and given the frequency of animal actinomycosis in Touraine, the disease must have been of alimentary origin. A cervical phlegmon first appeared, of greater consistency and hardness than are found in the ordinary phlegmons, and to which he proposes to apply the name of cervical actinomycotic pseudo phlegmon.

The results of the treatment by the iodide were so satisfactory that the author is tempted, after Thomassen, to consider potassium iodide as a specific in the treatment of the disease.

### The Use of Cocaine in Small-Pox.

Dr. Samayoa, (*La Escuela de Medicina of Guatemala*; *Pacific Med*) after using this alkaloid in several cases of small-pox, states his results as follows.

1. Cocaine given continuously from the beginning can completely abort the disease.

2. If given after the eruption has appeard, it will transform confluent or hemorrhagic forms into the discrete.

3. Sometimes when the cocaine is given from the beginning of the disease, the eruption assumes a *corneal aspect*, and the pustules collapse before the usual time.

4. Cocaine prevents suppuration, hence there is no secondary fever, and no pitting.

5. To obtain these results it is necessary to give cocaine as soon as the initial symptoms appear, *and must be continued, without interruption.*

6. The best preparation is the hydrochlorate, and should be continued five or six days or even nine if necessary.

### Heart Failure.

In an article by Dr. J. W. Maddin, Nashville *Jour. of Med. and Surg.* the following conclusions are arrived at:

"Whatever produces unhealthy structures of nerve fibre, nerve cells, or nerve ganglia, or the tissue to which they are distributed and upon which they act, preventing normal impulses, which regulate automatic and reflex movement, such causes as reside in errors of healthy sanguification producing degeneration of tissue, especially heart tissue, or tissue of blood vessels which nourish the heart, are potent factors of heart failure.

Whatever stimuli, mechanical tumors, abnormal elements of the blood, chemical poisons, or other causes which produce pressure or undue irritation upon nerve tracts, nerve cells or ganglia of the heart, impairing healthy metabolism and normal impulse, are causes of heart failure.

High temperature of the atmosphere, combined with conditions predisposing to sunstroke from without the body, or high temperature of the body from fevers, producing *heat stroke* from within, paralyzing sympathetic and vaso-motor power, determining blood flow to the cavities of the body, and giving full play to the inhibiting power of the vagus, will slow, still and stop the heart action.

Finally, whatever of the natare of shock, whether from a blow without the body, or equally, through a subtle blow to the emotional nerve centers of the brain, whether through grief or fear, or anger, or other emotion which produces molecular change in the axilla cylinder of nerves leading from end organs of the body or from emotional brain centers through the medulla oblongata where these fibres cerebral, vaso-motor, sympathetic, and inhibitory—commingle will by parlaysis produce that most sudden, irremediable and quickly fatal of all heart failures."

### A Case of Diffuse of Gangrene of the Left Lung.

The patient was a school boy aged ten years, and the accident occuring during the operation of excision of the left knee-joint, and the removal of a sequestrum from the femur The pulmonary symptoms appeared two days after the operation, and died sixteen days after the operation.

The post-mortem examination showed the presence of a diffuse gangrene of the left lung due to the presence of a temporary molar tooth, which was supposed to have got into the bronchus when the patient was under the chloro form at the time of the operation on the knee-joint and femur.

### Treatment of Asthma.

Prof. Dieulafoy (*Gaceta Med. Catalana*) treats asthma as follows:

1. If the attack is just coming on, he applies the following to the interior of the nasal cavity:

℞ Cocain. Muriat..... 15 grains.
Aquae Destillat..... 5 drachms.

Or this solution may be applied to the nasal cavity or throat by means of a spray, a teaspoonful being thrown in in four or five minutes. If this does not suffice, six to twelve drops of pyridin may be inhaled from a handkerchief, or one fluid drachm may be poured upon a cloth and kept near the patient's chair. Stramonium leaves and nitrated paper may be stuffed into a large pipe in alternate layers and smoked, if the attack is well under way. If the attack is at its height, then one may inject half a hypodermic syringeful of—

℞ Morphin Mur..... 1½ grains.
Aquae Distillat..... 2½ drachms.

This usually has a sedative influence. Repeat in a quarter of an hour, if necessary.

2. In the intervals administer the iodide of potash, twenty-two to thirty grains daily, commencing with four grains a day, and increasing the dose to fifteen, twenty-two, or even thirty grains if the asthma be of long duration.

3. If the disease be of diasthetic origin give during fifteen days fifteen to thirty grains of the iodide of potash, to follow with fifteen days belladonna:

℞ Pulv. Folior. Belladonnae..... 3 grains.
Extract Belladonnae..... 3 grains.

Sufficient for twenty pills. Commence with one-half a pill, increasing to one pill a day.

At the same time prescribe:

℞ Sodii Arseniat..... 1 grain.
Aquae Destillat..... 2½ ounces.

This treatment should be continued three to six months.

4. If there be emphysema, inhalations of compressed air.

Residence in mountainous and elevated countries should be avoided. Strong odors are among the exciting causes.

## ARMY AND NAVY.

U. S. ARMY, FROM DECEMBER 10, 1893, TO DECEMBER 19, 1893.

First Lieutenant John S. Kulp Assistant Surgeon, now on temporary duty at Jackson Park, Chicago, Illinois, is relieved from further duty at Columbus Barracks, Ohio, and when his services, are no longer needed with the troops at Jackson Park, will report in person to the Commanding Officer Fort Sheridan, Illinois, for duty at that post.

First Lieutenant Madison M. Brewer, Assistant Surgeon, having relinguished the unexpired portion of his sick leave of absence will report in person to the Commanding Officer, Fort Monroe, Virginia, for temporary duty at that post.

Leave of absence for four months, to take effect about January 6, 1894, with permission to go beyond Sea is granted Major Alfred C. Girard, Surgeon U. S. Army.

## NEWS AND MISCELLANY.

### International Medical Congress.

The undersigned Chairman of the American National Committee of the Eleventh International Medical Congress has received the following communications from the Secretary General:

First. Papers to be read in any of the Sections of the Congress should be announced on or before January 31st, 1894, to the Secretary General, Prof. E. Maragliano, Ospedale Pammatone, Genova, Italy.

Second. The title of the paper ought to be accompanied with a brief abstract of its contents and conslusions.

Third. The programme to be distributed will contain the titles of all the papers announced before August 31st, 1893, and since.

Fourth. The reductions granted by the Railway Companies months ago will be available from March 1st to April 30th, 1894.

In the interest of such medical men as will sail for Europe before official cards will have been received from the General Committee, the undersigned proposes to supply in as official a form as he thinks he is justified in doing, credentials which are expected to be of some practical value. It is suggested, besides, that a passport may increase the traveler's facilities.

Very respectfully,
A. JACOBI, M. D.
110 W. 34th Street, New York,
Dec. 10th, 1803.

### Reduced Rates for the Holidays.

In pursuance of its liberal policy, the Baltimore and Ohio Railroad Company announces that excursion tickets will be sold between all stations on its lines east of the Ohio River during the Christmas and New Year holidays at reduced rates. The tickets will be sold for all trains December 23, 24, 25, 30, 31 and January 1, and will be valid for the return journey on all trains until January 3 inclusive.

### Through Cars to New Orleans.

Among the many important improvements in the Baltimore and Ohio Railroad train service is the addition of through pullman Sleeping Cars from New York to New Orleans, via Philadelphia, Baltimore, Washington, and the famous Shenandoah Valley route, passing through Roanoke, Knoxville, Chattanooga and Birmingham. The train leaves New York daily at 5.00 P. M.; Philadelphia, 12th and Market Sts., 7.22 P. M and 24th and Chestnut Sts. 7.38 P. M., reaching Roanoke at 7.50 A. M.; Knoxville, 3.52 P. M., and New Orleans, 12.45 P. M.

This train is very handsomely appointed, being vestibuted throughout, and has Dining Car service New York to Chattanooga. At Washington a Pullman Sleeping Car, which runs through to Memphis, is added to the train.

# Dysmenorrhœa

## AND ITS ALLEVIATION.

OVARIAN. INTERMENSTRUAL. MEMBRANOUS.
SPASMODIC. NEURALGIC. TUBAL.

The prominent symptom in all cases of dysmenorrhœa, is the severe pain which demands relief, and which in nearly every instance, is mitigated by the use of whiskey or morphia, both of which are very injurious. A succedaneum for whiskey and morphia is a great desideratum, and this we find in ANTIKAMNIA (opposed to pain). Samples in powder and tablet form, sent free on application.

## A CONTRIBUTION TO THE STUDY OF THE MYELIN DEGENERATION OF THE PULMONARY ALVEOLAR EPITHELIUM.*

VERANUS A. MOORE, M. D., Washington, D. C.

In 1854 Virchow (1) described as myelin drops a substance which he found in several tissues of the human body. Nearly twenty years later Buhl described a similar substance in the pulmonary alveolar cells and attached much importance to its presence. A few other investigators have referred to the alveolar cells containing this substance in the sputum of both healthy and diseased individuals; but the conclusions which have been reached are so widely separated that further investigations are necessary to complete our knowledge of this interesting metamorphosis. The only fact which seems to be fully established concerning it, is that under certain conditions, which have not been clearly defined, these cells undergo a very peculiar change which was designated by Buhl as *myelin degeneration* on account of the resemblance of the resultant substance to the drops of myelin which escape from the cut ends of nerve fibers. The fact has not heretofore been clearly determined whether these cells are subject to this change while they are still attached to the alveolar wall, or whether it is a process peculiar to their dissolution, induced after they are separated from their source of nutrition. The simple fact has been observed that in the alveolar cells that are found in the sputum, this degeneration is sometimes present. Its importance is somewhat speculative although several opinions have been expressed concerning its significance.

Buhl (2) considered the myelin degeneration of the alveolar cells to be of special value in the diagnosis of desquamative pneumonia and in differentiating it from fibrous pneumonia which it resembles in many particulars. Bizzozero (6), and Guttmann and Smidt (5) found alveolar cells undergoing this change in the sputum of healthy individuals, especially in those who had passed the age of thirty. Senator (7) has reported finding these orops in the cells from the deep layers of the bronchial epithelium. Hoffmann (8) and Lenhartz (9) considered them of diagnostic importance in valvular trouble of the heart on account of the blood pigment which they frequently contain. Sommerbrodt (3), and Kronig (10) agree essentially with Hoffmann in his views of their diagnostic importance.

### DEGENERATING ALVEOLAR CELLS AND THEIR PRODUCTS IN THE SPUTUM.

In the fall of 1891 I had occasion to examine several specimens of sputum from a married lady, aged about 30 years, who was suffering from pulmonary tuberculosis. In the examination of the sputum in the fresh[1] condition my attention was directed in addition to the elements usually found in tubercular sputum to a considerable number of large,

* Read before the American Microscopical Society, Madison, Wis, August, 1893.

1 Attention should be called to the importance of examining sputum in a fresh condition. There are, to be sure, specific methods by which particular objects are demonstrated, as for example, tubercle bacilli, but in the examination for the bacilli only, many other structures may be destroyed, and consequently entirely escape the attention of the observer. The value of examining, microscopically, tissues in a fresh condition, seems to be overlooked by a large number of microcopists, who rely upon the examination of stained preparations only.

squamous cells varying in size from two to four times that of leucocytes. They were finely or more coarsely granular and in some instances they contained within the cellular substance several quite large, round or pear-shaped bodies. There were also a large number of free bodies in the sputum varying in size from mere points to 20 micro-millimeters in diameter. They were round, pear-shaped, pointed and irregular in form, and of a homogeneous, neutral gray or pearly appearance. A few of the larger forms exhibited a stratified condition. Usually they presented a double contour and resembled somewhat closely the myelin drops found in teased preparations of nerve tissue. Up to that time I had considered these sells and free bodies which has occasionally been observed as cells undergoing fatty degeneration and fat globules. In these examinations I became convinced that these bodies were not the product of fatty changes and their interpretation occasioned no little study. Finally the cells were identified with the alveolar cells described by Buhl and the free bodies were found to be the production of the myelin degeneration of the alveolar cells. The specimens of sputum that were subsequently examined contained an innumerable number of these forms. Tubercle bacilli were present in large numbers. The patient was sent to the mountains where she improved but nearly two years later, Spring of 1893, the sputum contained these bodies in large numbers.

Further examination of the alevolar cells in tubercular sputum showed them to be present in four forms: (1) cells varying from 10 to 15 micro-millimeters in diameter, with the cellular protoplasm finely granular and the nuclei distinct; (2) cells similar to (1) but containing more or less pigment; (3) cells slightly larger than (1) and filled with small bright bodies with or without pigment, nuclei not distinct; and (4) cells very much larger, 30 to 40 micro-millimeters in diameter, and filled with small and much larger bodies of a high refractive index, and the nuclei entirely obliterated. The forms described under (1) and (2) were differentiated from other epithelial cells by their size and form and those designated under (3) and (4) by their size and the character of the bodies which they contained. Bizzozero speaks of fatty alveolar cells but in my investigations the bright bodies within these cells have not reacted to the reagents for fat globules although they resemble them very closely in their microscopic appearance. Where the myelin degeneratian is more advanced the cells were frequently broken down and the myelin bodies were observed escaping from the cells. The pigment is either of an extraneous nature, such as fine particles of coal, iron dust, or other pigmentary substances that were inhaled during respiration or to the pigment from the blood. I have observed the pigmented cells a few times only and in all of these cases it was evidently of an extraneous character.

The free bodies in the sputum are exceedingly interesting from the great variety of forms and sizes which they display. Frequently they give the appearance of a band of grayish, homogeneous substance wound and twisted into a variety of forms. The round forms appear with a uniform, rather thick, periphery and a central marking, which at times resembles a perforation. In the pear-shaped and pointed forms there is almost invariably a central longitudinal marking. In some of the larger homogeneous bodies the beginning of a laminated condition was observed. In other cells it was more advanced, and in still others the lamination was nearly complete. In watching these bodies for a little time they were observed to change their form. In the larger homogeneous bodies the change resembled somewhat closely the amœboid movement, but it was undoubtedly due to a passive motion produced in the flexible, elastic bodies by the action of currents in the preparation, or by the pressure of the cover-glass. In the stratified forms there were frequently observed quite jerky or springy movements of the laminæ. The lamination and subsequent breaking up of the laminæ appear to be the last stages in the degeneration of the cells. The source of the large forms is explained on the supposition that in the metamorphosis of the cells the small bodies usually observed coalesce, forming one or more large masses. A few cells have been observed which contained these large bodies.

### THE REACTION OF THE DEGENERATING ALVEOLAR CELLS TO MICRO CHEMICAL RE-AGENTS.

The myelin bodies either free or within the epithelial cells do not react readily to the ordinary micro-chemical re-agents.

In a preparation of sputum (prepared by placing a drop on a slide and covering it with a cover-glass), the large alveolar cells and free bodies can be readily observed, by the aid of a 4mm. objective. If to the preparation a few drops of a ten per cent. solution of potassium hydrate is added (allowed to pass under the cover-glass) the mucous substance is dissolved and the free myelin-drop-like bodies stand out very clearly. The larger alveolar cells are disintegrated and the contained bodies set free. This is the most valuable reagent which I have found in studying these forms. The myelin bodies are rapidly destroyed by alcohol, less quickly with weak acids. They do not take any of the stains ordinarily used in histological or bacteriological work. Osmic acid produces a very faint brownish color, Kaatzer (11) found osmic acid to produce a deep black color. In sputum that has stood for some time (several weeks in a cool place) iodine in iodide of potash (iodine 1 gram, iodide of potash 2 grams, distilled water 300cc.) imparts a faint lemon color in the homogeneous forms. This color is not changed by the addition of sulphuric acid. They are affected slowly by ether. The fact that they are destroyed by alcohol renders their demonstration in mounted lung tissue practically impossible. In sputum hardened* in picric-acid-alcohol imbedded in paraffin, and sectioned. I have been able to detect these bodies in a much shrunken condition, but they are not satisfactorily demonstrated in this way. Their identity with myelin is not yet postively established, but, so far as I have been able to determine, they resemble it more closely than any of the other substances that have been found in the animal body. Until the chemical nature of this substance is more accurately determined it seems best to adopt the term used by Buhl and others. Future investigations, however, may demonstrate that it is not so closely related to myelin as we may think it is, and consequently the term "myelin degeneration," may have only a temporary existence.

*In an article on the technique and value of sputum-examination (*Medical News*, May 14, 1892) I called attention to the value, and described the technique, of sectioning sputum for the study of the relation of the tubercle bacilli to the yellowish more dense particles in the sputum. Although this method can not be recommended for the demonstration of tubercle bacilli it is possessed of certain advantages for the histological study of sputum.

The very large number of degenerating alveolar cells in the specimens of tubercular sputum from the individual mentioned, led to a somewhat careful search for these cells in other specimens which I have had occasion to examine. They have appeared in over ninety per cent. of these specimens. In several instances they could not be found in the first specimens received, but in subsequent ones they were present. Occasionally they could be found in only one or two preparations from a large number made from the same specimen of sputum. I have also found them in large numbers in several specimens of sputum in which no tubercle bacilli could be found, but in which there was much pus and many spheroidal (basement) epithelial cells from the bronchi. I have also found them in the sputum of people suffering from a slight cough (bronchitis), and in a few specimens from people twenty-five years of age and older, who were believed to be perfectly healthy.

Through the kindness of Dr. Wellington (at that time resident physician at the Children's Hospital, Washington, D. C.) I obtained lung tissue from a few fatal cases of tuberculosis. A most interesting case was one of general tuberculosis in a girl about six years of age. There were comparatively few tubercles in the lungs. They were small, and in the piece which I received they were separated from each other by a distance of from 2–5 cm. The intervening tissue was apparently normal. The alveolar epithelium from near the tubercles and from the intervening normal tissue was very carefully examined. In alveolar cells, from near the tubercles, there were a large number of myelin bodies, varying in diameter from 0.2 to 4.0 micro. millimeters. When treated with potash the cells were disintegrated and the enclosed bodies set free. They could not be distinguished from those found in sputum. In the tissue most remote from the tubercles the alveolar cells rarely contained the myelin bodies, although they were occasionally observed. This is interesting, as in the tissue immediately adjoining the tubercle almost every cell was undergoing this degeneration. All of the cells were not detached from the alveolar wall. Like the sputum, these bodies could not be detected in sections of the lung hardened in alcohol.

MYELIN DEGENERATION OF ALVEOLAR EPITHELIUM IN ANIMALS.

The appearance of these bodies in the alveolar cells of the human lung led to the examination of the lungs of different animals. In pigs, rabbits, guinea pigs, and mice, that perished from swine plague, hog cholera, or other virulent bacteria, the myelin degeneration of the alveolar cells was demonstrated by the aid of a ten per cent. potash solution in all of the cases examined. The technique necessary to bring out these myelin drops was very simple. Sometimes they could be seen very clearly when a bit of the lung tissue was teased in normal salt solution. Usually, however, it was necessary to add to the preparation a few drops of the solution of potassium hydrate, which would dissolve the cellular substance and leave the minute and larger myelin bodies free. These were usually pointed or pear-shaped and exhibited the longitudinal marking. They differed in no appreciable manner from those found in the human lung or sputum. In healthy animals that were killed by bleeding or with chloroform, very few of the alveolar cells were found to contain these drops. Frequently they could not be found at all. In lungs that were not examined for from two to three days after the death of the animal, the myelin degeneration of the alveolar cells was more common. In lungs of cattle affected with pleuro-pneumonia, Dr. Theobald Smith found the alveolar cells to contain bodies which presumably were the same as those which I have found in other animals. They differed, however, in being more uniform in size. In 1890 I observed similar forms in the alveolar cells of a cow's lung which contained actinomycosis and a small amount of accompanying pneumonia, but at that time their nature was not determined.

From my observations, the myelin degeneration of the alveolar epithelial cells may be looked for, (1) in the sputum of people suffering from pulmonary tuberculosis and certain other more or less serious lung disturbances; (2) in the lungs of certain species of animals (and probably in all vertebrates) that have suffered from a disease in which there was more or less fever before death, either with or without a localization of the disease in the lungs (the more the lungs are affected the more numerous are the myelin drops); and (3) in the sputum of people of twenty-five years of age or older, and in the lungs of healthy animals; in these, however, the myelin degeneration is more rarely found, and the number of cells undergoing this change are very few compared with the number in the diseased lung. This would indicate that the myelin degeneration is the course through which the pulmonary alveolar cells naturally pass in their final disintegration, and that this process is hastened by the influence of certain diseases. Virchow (1) found myelin drops in the various organs of the body, and Panizza (4) found them to be a product of the mucous membrane of the mouth of frogs; with these exceptions they appear to have been observed only in the pulmonary alveolar epithelial cells. Panizza considered the myelin drops to be a product of mucin. The appearance of this metamorphosis in the alveolar cells of such a large number of animals indicates its universality and points out another interesting condition which may be studied in the lower animals, and about which much may be learned without waiting for the accumulation of facts from the human species. Although I have examined the lungs of a large number of animals under the conditions previously stated, other work has prevented a more exhaustive study of the conditions under which this metamorphosis occurs.

My opportunities have not been such that I could accumulate data upon the practical or diagnostic value of these peculiar cells in the human sputum. It is hoped that those who have clinical advantages will make good use of their material and microscopes, so that in the near future the diagnostic value or non-significance of these forms may be clearly established. It is probable, however, that they will be found in a large variety of inflammatory affections of the lungs, but is no impossible that they may be, to a limitedt extent, of diagnostic value, especially in young individuals:

## DIPHTHERIA AND SCARLET FEVER AT THE BOSTON CITY HOSPITAL*

A. L. MASON, M. D.

The history of scarlet fever repeats itself in the periodic outbreaks such as the one we are now going through, in which not only the number of cases throughout the city shows a manifold increase over average years, but the disease also assumes a more virulent type, as shown by a higher death-rate in the Board of Health reports. Thus during the past twelve years the minimum number of cases throughout the city shows a manifold increase over average years, but the disease also assumes a more virulent type as shown by a higher death-rate in the Board of Health reports. Thus during the past twelve years the minimum number of cases reported was 383 in 1881, the maximum 2,938 in 1892, the death-rate varying from 4.5 to 16.6 per cent. in different years, the highest and lowest rates, however, not corresponding very closely with the years of greatest and least prevalence.

With diphtheria the history has been a different one. The first recorded deaths from this disease occured in Boston only thirty-three years ago. Physicans were then unfamiliar with it. If it prevailed under other names in earlier days it had become sporadic or had disappeared again. In 1859 there were but 19 deaths from this cause in Boston. The number gradually increased to 72 deaths in 1874, and in 1875 suddenly rose to 420. From this time it may be said to have become endemic, although the increase in mortality from this source has by no means corresponded with the growth of the city or the unfavorable elements of the recent immigration. Indeed, there were but 401 deaths from diphtheria in Boston in 1890, and in 1891 only 232, the number rising again to 414 in 1892. Unlike scarlet fever, however, the ratio of deaths to reported cases is always a high one, about 30 per cent.; in some years more than one-third, never less than one-fourth, resulting fatally.

About one-sixth of all reported cases of diphtheria and scarlet fever in Boston are admitted to the City Hospital, the only institution where they can be received. The result, in scarlet fever, shows no great variation from that which obtains in the city at large,— a mortality of 5 or 6 per cent. in certain years, and an increase to double that rate when grave complications prevail.

In recent years, especially during the epidemic of 1892 93, a very formidable class of cases has appeared in increasing numbers; namely, those in which scarlet fever is accompanied by diphtheria. In 1890 there were 4 such cases at the Hospital; in 1891, 24; and, in 1892, 90 out of a total of 332. Of these 118 anginose cases, 51 died. They were all admitted to the scarlet fever ward, as presenting primarily the appearance of that disease.

In a previous report,† relating to the period from 1880 to 1888, the present writer stated that "a frequent complication was a condition which could not be distinguished clinically from diphtheria. Either at entrance or in the early days the tonsils and fauces were covered with a dirty, gray, diphtheritic membrane often foul in odor, accompanied by a nasal discharge and glandular swelling. There were 40 such cases (out of 450). 7 were transferred to the surgical department for tracheotomy, and 5 others died. The rash in these cases had the typical appearance of scarlet fever. Post-diphtheritic' paralysis developed in several instances.'

Since that time there has been much discussion as to the exact status of these mixed cases; and many observers have decided, from bacteriological studies of certain collections of cases, that the faucial inflammation was not true diphtheria, but a pseudo-membranous exudation, characterized by the presence of streptococci, and other organisms, seldom, however, by the Klebs-Loeffler bacillus of diphtheria.

But the results of bacteriological examinations and cultures at the City Hospital during the past year, for which I am indebted to Dr. F. H. Williams and Dr.

*Bul. Harvard Medical School Asssociation.

† City Hospital Reports, Fourth Series, p. 165.

Councilman, who made the experiments show that in a certain number of these cases the Klebs-Loeffler bacillus is present. Not infrequently, too, retraction of the soft parts has been observed from obstruction of the larynx and trachea, and intubation has been necessary. Post-diphtheritic paralysis has occurred. In short, true diphtheria has run its course coincidently with scarlatina in some of these complicated cases. Occasionally they come in groups, several from the same family, and are always isolated. The great fatality from sepsis, and the occurrence of croup, would also point to the probable presence of the bacillus diphtheriæ. The ordinary scarlatinal sore throat, the streptococcus-pseudo-diphtheria, does not produce croup by extension of the false membrane to the larynx and bronchi.

Six cases of measles presented also the clinical appearances of diphtheria, and three of them were fatal; but no cultures were made.

Turning to the diphtheria department, we find always a high mortality, higher than that which prevails in the city at large, but not higher than would be expected from the bad, even hopeless, condition of many patients when admitted. They come for operation as the last resort, when the advantage of early tracheotomy or intubation has been lost. The extension of membrane to the trachea and bronchi, profound sepsis, or pneumonia, renders all efforts to save life unavailing. More than half the deaths occur within four days after admission. Of 759 cases admitted between July, 1890, and January, 1893, 352 proved fatal, or 46 per cent. 246, or nearly one-third, required operation for obstructed respiration,— a much larger proportion than obtains in general practice. Of the remaining 513 cases, three-fourths recovered; and that is the usual percentage at the Hopital for a series of thirteen years in cases in which no surgical relief has been needed. Most adults are treated with success. That makes the record favorable as compared with hospitals where children only are received, and in which the death-rate is 70 per cent., sometimes 80.

For instance, Henoch, of Berlin (Charité Annalen, vol. x.), reports 208 deaths in 319 cases, 65 per cent.,—a mortality of 45 per cent. in the pharyngeal cases, and nearly 90 per cent. in the croupous. 16 only survived out of 145 tracheotomies.

The statistics of Besnier show a similar result in the children's hospitals of Paris, where the mortality ranged from 54 per cent. in summer to 83 in winter. Of 919 cases admitted in the last quarter during seven years, the mortality was 71 per cent.

Roux and Yersin found the diphtheria bacillus in 61 out of 80 children in hospitals. In 19 this organism was absent, and they all got well; but one-half of those who had diphtheria died.

It is the same in all large cities, the most fatal and the most distressing to witness of all the diseases with which we have to deal.

A point of much interest, in view of the advances in bacteriological science, relates to the diagnosis of mild cases of diphtheria, and their differentiation from other forms of faucial inflammation which are so often sent to hospitals as diphtheria.

Besides 759 cases mentioned above, in the same period 113 cases of non-diptheritic tonsillitis and laryngitis were sent to the City Hospital as diphtheria. There were also 23 cases recorded as "doubtful" from a clincal point of view. In such cases, if diphtheria exists, it cannot be determined by ordinary inspection, nor can it always be positively excluded. Time usually shows. These patients were isolated as well as possible in the diphtheria ward; and none took diphtheria so far as known. All got well but one, a case marked as "doubtful."

The punctate spots on the follicular exudate, their localization on the tonsil while the uvula and pharynx remain free, the chills, headache, high fever, and pains in the limbs at the outset, the easy removal of the secretion by swabbing,— these and other signs often suffice to distinguish acute follicular tonsillitis from the more insidious development of diphtheria. But sometimes these appearances prove deceptive. In a day or two the membrane develops, and the bacteriological test shows the Klebs-Loeffler bacillus.

The streptococcus-pseudo-diphtheria can only be determined by culture experiment but it is a relatively mild affection.

Therefore, the following suggestions are obvious: —

First, the necessity for bacterial culture in all doubtful cases.

Second, the desirability of isolating such cases in the interval.

During the last year or two careful bacterial examinations have been made at the Hospital by Dr. F. Williams, and cultures in many cases by Dr. Councilman. These researches will be published at an early day. Much time and skilled assistance are necessary to carry out this work thoroughly; but in the new buildings there will be ample facilities for the prosecution of this branch of scientific study.

It is interesting to note that these numerous patients with non-diphtheritic inflammations of the throat showed little or no tendency to contract diphtheria. Many were adults. The extreme susceptibility as well as the great danger to life, is limited to early childhood, under circumstances which involve the closest proximity to the source of infection. Transmission through a third person is probably infrequent. Most nurses undergo daily extreme exposure with impunity, while the few susceptible ones sooner or later take the disease. Many acquire the utmost confidence in their immunity. Sad casualties, however, have occurred, both to House Physicians and to nurses, whose professional zeal and devotion to duty have proved stronger than their desire for self-protection. The presence in the community of a body of thoroughly trained and fearless nurses for this often terrible malady is a boon which has been appreciated by many a suffering family.

*Diphtheria Treatment.*—The indications for treatment are: 1. The maintenance of the strength of the patient. 2. The destruction of the bacillus by local applications. 3. The elimination of the germ-product (tox-albumen), which pervades the system, and lingers long after the membrane has disappeared.

*General Measures.*—After nutriment, alcoholic stimulants, in large and frequent doses, claim the most important place in our efforts to sustain the ebbing strength. Young children may take several ounces of brandy daily with good effect. Digitalis and other cardiac stimulants have little influence. The tincture of the chloride of iron is largely used to combat the anæmia which so rapidly develops. Oxygen by inhalation, as advised by Brétonneau in 1821, has value in prolonging the struggle against asphyxia.

But, unfortunately, in many cases, vomiting, from gastric or pneumogastric irritability, makes sustenance difficult. Paralysis may prevent swallowing. The rectum soon becomes intolerant of nutritive enemata, and then the stomach tube is the only resort. If the membranes invade the larynx, early tracheotomy or intubation saves many cases in which the trachea and bronchi remain free; and a certain number of cases with croup get well without operation. Steam often relieves the breathing, temporarily at least. After profound septic poisoning has occurred, with masses of enlarged glands and brawny neck, foul nasal discharge, and, perhaps, uncontrollable hemorrhagic oozing from mouth and nose, we can only try to promote euthanasia. Antiseptic drugs are of little or no value internally.

Many bad cases, however, and some desperate ones, are carried through by careful feeding and stimulating, good nursing, and persistent local treatment.

*Local Treatment.*—Since the agency of the bacillus diphtheriæ has been more fully recognized, renewed efforts have been made to find substances which will remove the exudation and destroy the underlying bacilli. Here, again, we revert to the advice of Bretonneau, who says: "Tonsillar diphtheria, by its vicinity, threatening the air-passages with imminent danger of extension, requires the most expeditious and complete local treatment." Nitrate of silver was his favorite remedy, and in enormous quantities. But there are obvious objections to the use of nitrate of silver and the strong mineral acids which do not apply to some of the milder agents.

Here it must be born in mind, with regard to persistent local treatment in general, that the strength of the child is to be carefully considered, and the extent to which the process has gone,—whether the pain and exhaustion of frequent topical applications to the throat and nose of a frightened and struggling patient are not more harmful than any benefit to be derived therefrom. Routine treatment may be very bad. In some cases, one or two applications a day, and those in a recumbent position, may be all that can be safely attempted. In others, the discipline of the gag may be salutary.

Touching the tonsils two or three times with chromic acid, at an early stage, may suffice to remove the deposit; and a spray of corrosive sublimate, 1 to 10,000 is destructive to superficial germs. Loeffler's culture experiments showed, however, that

a strength of 1 to 1,000 for twenty seconds was necessary to kill the deeper bacilli in the media employed. Even the weaker solution, 1 to 10,000, cannot be used with impunity in young children.

Carbolic acid, 5 per cent, combined with alcohol, sterilizes, but may also be toxic.

Chlorine water and chloride of lime in strong solutions are active disinfectants. The former substance, injected beneath the membrane by means of a syringe devised for the purpose, was thought by Dr. A. Seibert to be the strongest, safe remedy, the solution thus reaching the active bacilli in the deeper tissues. This author thinks that the superficial exudate is of little importance and inert (Archives of Pediatrics, 1891).

This is open to question, however; and the decomposing membrane can in many cases be readily cleared away by the peroxide of hydrogen. The action of this agent, if of sufficient strength, is very striking, the exudate disappearing at once in an effervescent froth, and leaving the surface free for the action of other germicides, of which corrosive sublimate must be regarded as the most powerful, and, if not too frequently applied, comparatively safe.

Hydrogen peroxide in 50-volume solution has been used at the City Hospital by Dr. F. H. Williams, as described in his paper published last year. It rapidly clears the throat of membranes and of odor and has no harmful effect upon the sound tissues. Neither is it poisonous. Frequent spraying with the 10-volume solution often suffices to keep the diseased surfaces clean, to prevent the spread of the membranes, and to check glandular swelling and sepsis. It may be used with care in the nose. The pain of all local applications should be mitigated by cocaine.

Loeffler found salicylic acid, permanganate of potash, chlorate of potash, resorcin, iodine, and many other substances relatively poor germicides, except the very strong solutions of some of them.

Primary nasal diphtheria is probably more common than is supposed and a not infrequent source of unsuspected danger. The secondary involvement of the nasopharynx in ordinary cases adds greatly to the danger of sepsis through the lymphatics. But caution is required in the employment of the nasal douche, syringe or atomizer, which the impervious passages render very painful. Acute inflammation of the middle ear with bloody discharge is a common result when the fluids are forced through the Eustachian tube. Therefore, it is very difficult to disinfect the nose in young children; and the gentle introduction of warm, mild, saline solutions and vaporized spray is best tolerated.

Not to dwell at length upon the dangers from cardiac and respiratory paralysis, a rapid pulse during convalescence must always be regarded as a warning that recumbency is essential. Irregularity in the beat, pallor, or vomiting, may be the forerunner of collapse from pneumogastric neuritis. Absence of knee-jerk may develop very early or not until very late in convalescence; and the knee-jerk may be normal throughout, even with paralysis of accommodation and of the soft palate, slight in degree. Muscular paresis often goes unobserved. Strychnine is the best remedy, by the mouth or subcutaneosly; and with children it is a good plan to administer tincture of nux vomica, one to five drops, three times daily, from the beginning of the illness.

French and German observations as to the nature of the subtle virus of diphtheria show that sterilized cultures from the membrane yield a soluble substance, probably a tox-albumen, which kills animals.

As the Klebs-Loeffler bacillus is found in the throat and nose some time after the disappearance of the membranes this accounts for their occasional recurrence for several days. Disinfecting sprays and gargles should not be too soon abandoned; and the patient should be isolated for a sufficient length of time to insure the safety of others, seldom less than one month. The elimination of the poison may be very slow, and should be aided by mild salines and diuretics, baths to promote free action of the skin, tonics, and gentle exercise in the fresh air. Mental and nervous depression may persist for many months.

"Doctor," said little Emily, "do you know that a baby that was fed on elephant's milk gained twenty pounds in one week?"

"Nonsense!" exclaimed the doctor; and then said whose baby was it?"

"It was the elephant's baby," replied little Emily.

# REMARKS UPON THE TREATMENT OF STRICTURE OF THE SIGMOID FLEXURE AND OF THE FIRST PORTION OF THE RECTUM.*

JOHN B. DEAVER, M. D.†

Mr. President and Fellows: My object in offering a few remarks upon stricture of the sigmoid flexure and of the first portion of the rectum this evening is to obtain the views of the Fellows present upon this, which is certainly a very important subject and to place upon record a case of stricture of the terminal portion of the sigmoid flexure of the first portion of the rectum, recently under my care, in which the passage of a flexible rubber bougie (Wales) but one size French scale, larger than that which had been passed many times before, caused perforation of the rectum below the stricture, resulting in the death of the patient within twenty-four hours thereafter from peritonitis. In order to discuss this subject to the best advantage I may be permitted to refer to one or two points in the anatomy of the rectum, also to say a word or two concerning the diagnosis of stricture situated beyond reach of the finger.

The rectum does not, as is usually described, begin at the rim of the pelvis opposite the sacro-iliac synchondrosis, whence it extends to about the centre of the third piece of sacrum and descends in front of the sacrum, the coccyx, etc., but commences at the terminal part of the omega loop, to which attention has been called by Treves as being the shape of the sigmoid flexure, and not "S" shaped in answer to the description in the text-books on anatomy. Careful examination by myself of many bodies has confirmed the above statement. All of the omega loop, which includes the first portion of the rectum, occupies the pelvis in the adult. It will be thus understood that the first portion of the rectum makes with the second portion a decided angle; therefore, an instrument of the calibre of the normal bowel, unless it be a flexible one which will pass throngh the third and the second portions, will not prove anything regarding the calibre of the first portion. Again, from the relation borne between the second and the first portions of the rectum much may be learned about the latter if it be not infiltrated, upon introducing the finger into the second portion, through the walls of which the infiltration may be detected. The best form of flexible rubber bougie is one which is hollow, as is the Wales instrument, to the lower end of which can be attached a fountain or Davidson syringe, and water thrown through this, favoring its passage by drawing out of the way the folds of the mucous membrane which would otherwise form an obstruction to its introduction.

The diagnosis of structure of the second and third portions of the rectum is readily made by the sense of touch. When the index finger is not long enough to reach beyond the second portion with the patient lying on the back, it may be done with ease if the patient be turned upon the left side and the thighs slightly flexed upon the abdomen and the finger introduced into the anus from behind, as the tissues of the perineum can be carried a little distance in advance of the web of the index and middle fingers. Contraction in this part of the bowel can often be diagnosed by the introduction of a short, flexible Wales bougie, but the finger is the more trustworthy instrument. This, too, is the only portion of the bowel where we will all admit that the operation of proctotomy for the relief of a contraction is admissible. The soft, flexible rubber bougie is the only instrument that can be carried safely as well as surely through the upper portion of the rectum and the sigmoid flexure. The use of the non-flexible rectal bougie is not only an unsafe instrument, particularly where the stricture is situated beyond the second portion of the rectum, but one which may mislead the surgeon in making a diagnosis of stricture when it does not exist.

The first portion of the rectum, like the sigmoid flexure, is connected to the back part of the abdominal cavity by a reflection of the peritoneum, the meso-rectum. On account of the bend made by the junction of the first and second portions of the rectum, it can be readily seen how the point of a non-flexible bougie is arrested by con-

* Read before the Philadelphia Academy of Surgery.

† Professor of Surgery in the Philadelphia Polyclinic and Assistant Professor of Surgical Anatomy, University of Pennsylvania.

tact with the wall of the bowel at this point, which offers resistance to its further passage, and a diagnosis of a pathological obstruction made; or it may be that the bowel, owing to the meso-rectum which, if preternaturally long, will be carried in advance of the point of the instrument to or beyond the median line in the neighborhood of the pubis, while if the instrument by chance should pass into the sigmoid flexure, the latter, owing to the meso-sigmoid, may be carried to or beyond the median line in the neighborhood of the umbilicus, which, in either event, might give rise to the belief that the bougie had passed into the bowel beyond, if not through, a supposed stricture.

There is a question of doubt in the minds of some as to the possibility of being able to carry a flexible rubber tube or bougie through and beyond the sigmoid flexure. This has been tried upon the dead body in a number of instances, and, not having proven successful, the deduction has therefore been made that it is impossible to do it in the living subject. While I am aware of the difficulty attendant upon the introduction of an instrument into the descending colon in the dead body, due chiefly to the absence of muscular contractility, which facilitates the passage of the instrument, on the one hand, and offers a very decided barrier against its introduction, on the other, also to the absence of the normal moisture in the shape of the mucus, I cannot admit this to be so.

We well know that it is much easier to introduce a bougie through the normal urethra in the living subject than it is in the cadaver, and yet this ought to be more readily accomplished in the case of the urethra, where counter-pressure can be brought to bear to aid in the introduction of the instrument than in the case of the bowel. I have very satisfactorily demonstrated upon many occasions the possibility of being able to circuit the sigmoid flexure rectal bougie and the long flexible colon tube. In certain cases of intestinal obstruction I regard the passage of a soft, flexible tube into the sigmoid flexure, through which water can be thrown and the capacity of the large bowel ascertained, an important aid in the diagnosis between obstruction of the small and obstruction of the large intestine.

With the subjective symptoms of stricture of the large bowel present, namely, constipation, or may be attacks of diarrhœa, the passage of ribbon-shaped stools or of choppy stools covered with mucous and blood, or preceded or followed by the passage of mucous and blood attended by tenesmus, the lower portion of the rectum being intact, as proven by a digital examination, it does not absolutely follow that a stricture is the cause in all instances, as we may see this train of symptoms consequent upon a sub-acute or chronic catarrhal inflammation of the colon, of the sigmoid alone, or in ulceration of the sigmoid flexure; therefore, before we can get more definitely at the exact condition of affairs it will be necessary to resort to instrumental interference in the introduction of graduated sizes of flexible rubber bougies, when a diagnosis can generally be arrived at with a very fair degree of certainty. This should be done with all due care, and preferably by one experienced in the use of these instruments, as it has been demonstrated, particularly in the case I reported to-night, that serious results can accrue from even the passage of a soft instrument, which argues strongly against the use of non- or semi-flexible instruments. From the relation the first portion of the rectum holds to the second when the former is the seat of extensive thickening or the walls contain a growth upon digital examination this can usually be detected. In this class of cases, as in disease of the second and third portions, if in the female, much can be learned by careful digital examination of the vagina. I have on several occasions been able to feel with the finger masses in the first portion of the rectum, as well the presence of a growth which had assumed some size in the terminal portion of the sigmoid by carrying the vault of the vagina well in advance of the examining finger, aided, too, by counter-pressure made over the abdominal walls. Further, I believe these examinations are better made without ether, having the feelings of the patient to guide us and with less risk of injuring the bowel.

Where a mass is suspected in connection with symptoms of stricture, which would suggest malignant disease, there is considerable to be gained, however, by giving the patient ether, under the influence of which the abdomen can be palpated more satisfactorily. Another means of diagnosis, that of dilating the

sphincter of the anus and the introduction of the hand into the rectum and the sigmoid, I have never had the courage to do. In cases of great doubt, rather than resort to the last procedure, I deem it more advisable to do an exploratory abdominal section. Exploratory abdominal section, however, done for the purpose of diagnosis in the questionable cases of stricture of the sigmoid and the first portion of the rectum, I am not a strong advocate of, as I think that a diagnosis in the majority of cases should be made without resorting to so complicated a measure. While I am aware of the little risk attending an exploratory abdominal section under strict cleanliness, I think the principal objection to be urged against it is that it lessens the responsibility of the surgeon as a diagnostician. Apart from this, I fear the modern tendency is too much in the direction of exploratory incisions in other regions of the body as well as the abdominal cavity, for diagnostic purposes.

The operation should be the natural sequence of the diagnosis and not the diagnosis to the operation. Perfecting one's self in diagnostic attainments is certainly more creditable to a surgeon than to feel forced to have to open the belly cavity to determine that which may be done without.

The majority of cases of benign stricture involving the first portion of the rectum are amenable to treatment by either the bougie or colotomy. Stricture of the sigmoid flexure, very rare except when of malignant origin, is not nearly so favorabe for gradual dilatation by the bougie. Stricture here located, be it benign or malignant, if the inflammatory process has not advanced too far to permit of resection and anastomosis, or perhaps circular enterorrhaphy, the most that can be hoped for in the majority of instances is the establishment of an artificial anus in the loin.

The choice between iliac and lumbar colotomy must depend upon the merits of each case; ordinarily I prefer to make the operation through the loin. The only advantage I can see in the anterior (iliac) operation is the opportunity it affords to determine definitely the condition of the bowel, if a resection and anastomosis or enterorrhaphy is possible, and, if nothing short of an artificial anus will suffice, the making of it at once.

In a paper I read before the Philadelphia County Medical Society two years ago upon "Lumbar versus Iliac Colotomy," I took the ground that the lumbar operation was the more preferable, inasmuch as the diagnosis of the condition rendering the operation of colotomy necessary should, in the majority of the cases, be made without having to open the peritoneal cavity, as is done in the iliac operation.

In benign stricture of the sigmoid flexure and of the first portion of the rectum, I recommend gradual dilatation by means of the flexible rubber bougie. When this is not possible, more radical measures must be adopted. In malignant stricture of the above portions of the bowel the bougie can do nothing other than harm; directly, by hastening the diseased process, and, indirectly, by misleading the patient in having him believe that an operation will not be required. I believe the earlier radical operative interference in malignant disease of the bowel is instituted the better, and if the practice was followed in all instances patients' lives would certainly be very materially prolonged and, in some cases, the disease perhaps be eradicated by removing it while yet local. What holds good in the uterus and elsewhere regarding affections of this character, holds equally good in cases of the bowel, the difficulty in affections of the latter organ being that not exposed to the sense of sight the diagnosis cannot be made with the same degree of certainty as in like conditions of the uterus, the breast, etc.

The advisability of furnishing the patient with a bougie and instructing him to pass it himself I am inclined to question; I think this is better done by the surgeon. In addition to instrumental and operative treatment, much is to be gained by constitutional treatment, particularly if the case be of specific origin; but unless the history clearly points to this, we should be careful not to push the treatment too far, for fear of the debilitating effects; by attention to the general health, by the administration of tonics, by advising the proper diet, by giving tonic laxatives to have the bowels moved daily.

In cases where tenesmus is excited by the presence of a collection of mucus it is advisable to introduce a long, flexible rubber tube beyond the stricture, through which the bowel can be irrigated with

warm water or with mild antiseptic astringents.

The following is the case I have referred to above: F. W. R., aged about thirty, consulted me July 27th, stating that he had a stricture of the large bowel, for which he was passing at intervals of from four to five days Nos. 9 and 11 Wales bougies by the advice of his physician. Upon being questioned, he described the symptoms characteristic of stricture of the sigmoid flexure or of the latter and first portion of the rectum. He further stated that without the aid of medicine taken internally or the use of enemas it was impossible for him to have a passage. Digital examination of the rectum revealed nothing other than a rather capacious organ. Examination with the bougie showed the presence of an unquestionable obstruction nine inches within the anus. I advised continuance of the local treatment, but disapproved of his using the bougie himself. I passed a bougie up to the time of his last visit to me, when, upon introducing one a size larger than the one usually used, namely, No. 12—which I had also passed before with but little difficulty —as the point of the instrument was engaging in the stricture he suddenly lurched forward upon the operating chair, and before I could withdraw the instrument he rebounded, as it were, upon the point of the bougie. This was immediately followed by severe abdominal pain. I feared the bowel had been penetrated on the anal side of the stricture, but was not certain, as the instrument was withdrawn clear of blood; neither was there any blood passed after its withdrawal. I advised that he go to the hospital, where he would have the benefit of absolute rest and at the same time give me the opportunity of having him closely observed. Contrary to my advice he went to his place of business but came back to my office some time afterward, complaining of the pain as when he left me earlier in the morning. He now consented to go to the hospital. The pain was so severe as to require large doses of morphine to relieve him. He would not consent to an abdominal section, therefore I was powerless to do other than administer abdominal anodynes, counter irritants, etc. He died the following night. The abdominal walls remained perfectly rigid, with the absence of tympany until four hours before he died, when there was pronounced distention. An autopsy made shortly after death showed the presence of a purulent peritonitis and a linear stricture involving the terminal portion of the sigmoid flexure and the first portion of the rectum. The bowel immediately below the stricture, which was very much dilated, with the wall nearly as thin as tissue paper, showed a perforation. Upon opening the bowel there were present cicatrices which were evidently the result of ulceration. There were present old adhesions in the abdominal cavity in the neighborhood of the descending colon and sigmoid flexure. Upon opening the chest there were present adhesions at the apices of the lungs. No further evidence of organic disease.

A few hours before his death, in a conversation with his mother, I learned, much to my surprise, that he had for some time back, been giving himself an enema after each meal; this, to some extent at least, accounted for the very much dilated and thin condition of the wall of the bowel, rendering it liable to penetration by the bougie.

Flossie is six years old. "Mamma," she asked one day, "if I get married will I have a husband like papa?"

"Yes," replied the mother, with an amused smile.

"And if I don't get married will I have to be an old maid like Aunt Kate?"

"Yes, Flossie."

"Mamma"—after a pause—"it's a tough world for us women, ain't it?"

---

Doctor—"Well, Dennis, did you take the pills I sent you?"

Dennis—"Indade, doctor, an' I did not; ye wrote on the box 'One pill three times a day,' an' I've been waitin' till I see you to ask you how a man was to take a little bit av a pill loike that three times in wan day?"—*Harper's Weekly.*

Medical Students in Switzerland. —The number of students in the medical faculties of the universities of Switzerland during the summer semester of 1893 are officially stated to have been as follows:—Zürich, 297; Geneva, 224; Bern, 224; Basel, 152; and Lausanne, 84.

## REPORT OF CASES.

J. H. VOJE, M. D., Oconomowoc, Wis.

### ABSCESS OF THE LUNGS.

During the summer of 1887 I was called to see Mr. F., age twenty-eight. I found the patient propped up in bed with pillows and apparently in the last stages of consumption—breathing with great dfficulty; profuse perspiration; great emaciation; rattling cough; profuse expectoration; temperature 104°; pulse 135; livid club-shaped fingers; but no tubercular history.

I thought a further examination almost useless. However, on attempting to percuss the back, I found the integument bulging and with fluctuation a hand-breadth below the angle of right scapula. After a moment's reflection I opened the abscess with the bistoury. About a pint of pus and tissue-shreds escaped. Coughing was set up, causing an increased flow of pus and air bubbles. After the flow had mostly ceased, I injected, at intervals, a sherry-colored solution of iodine, some of which was coughed up, the balance returning through the opening in the back. A large dressing of sublimate-gauze was applied, the patient feeling greatly relieved, being able to rest with the head much lower. A tonic mixture was prescribed and proper diet ordered.

The next day found the patient much improved. I had the family inject the iodine solution three times a day. Some of this the patient would cough up. The patient continued to improve from day to day, the discharge and cough getting less and less, and no temperature after two weeks. He came to my office in five weeks, with a small fistula in the back. This soon healed, and he has been well ever since, working in the pinery every winter.

### CASE II.

Mrs. B., aged thirty-two, married, one child, consulted me during the spring of 1891 about a swelling on the right side of the back, just below the angle of the scapula, which had been growing for several weeks. The patient had a tubercular history, a sister having died with pulmonary tuberculosis; had been losing flesh for the last year; had evening temperature, rapid pulse and night sweats. The skin was not discolored over the swelling, but, as distinct fluctuation was present, I made a $2\frac{1}{2}$-inch opening. When the pus escaped, a fit of coughing was set up and more pus and air followed through a small opening between the seventh and eighth ribs. An emulsion of iodoform was ordered to be injected twice a day, and the wound was reported to be healed in about four weeks. But the bulging returned in the back, of which I was not at once informed, and when the patient reported, the abscess had dissected in different directions, calling for several long openings. All were scraped, stuffed with iodoform gauze and the fistula leading to the cavity injected twice a day with five per cent. solution of pyoktanin in dilute alcohol, about four drams being injected each time. This would set up a severe coughing, followed for several hours by an intensely blue-colored expectoration.

The patient improved, soon gained in flesh, lost her night sweats and temperature and had a good appetite. The cavity became smaller and in about ten weeks all was healed, remaining so ever since. The patient is doing all her housework. Her pulse, however, is constantly over eighty, and the *habitus phthise* still present.

### TRIPLE HERNIA OF THE LINEA ALBA.

Mrs. S. had undergone operation for a a small parovarian cyst during September, 1891. She made a good recovery. The abdominal wound united firmly. After returning home she soon became pregnant, and two months after confinement reported with a very large triple hernia in the linea alba at the site of the cicatrix, caused, of course, by the distension of the uterus so soon after the operation. No contrivance would hold the enormous hernia in check, and the patient readily consented to an operation. During January, 1893, the patient was chloroformed, the integument over the hernia lifted up by an assistant, to cause the intestines to drop back into the abdominal cavity, and while thus held high it was freely divided. I could now see into the abdominal cavity through three not very large openings. These were cut into one with the scissors, and

all cicatricial tissue excised. The edges were thoroughly freshened, the distended integument trimmed, and the wound closed with strong silk, which I think fully as efficacious as silver wire. Recovery was rapid and complete. The patient was kept in bed for three weeks, and when discharged furnished with a London abdominal supporter. She is well to-day.

I think that herniæ in the linea alba occur more frequently than reported. The only cure is the radical operation.

---

### HAIRPIN IN THE FEMALE BLADDER.

During February, 1893, a somewhat anæmic but otherwise well-nourished nineteen-year-old farmer's daughter presented herself at the Institute, stating that she had had a hairpin in her bladder for over two weeks. She said that it had slipped away from her during an attempt to relieve an intense itching and pain at the neck of the bladder. Masturbation was denied, nor was there any marked signs of it, nor was the urethra dilated or easily dilatable. The urine was turgid and slightly decomposed.

Some fruitless efforts had been made by other physicians to remove the pin with forceps, etc. The only inconvenience the girl experienced from its presence was a little pain in the hypogastric region and frequent micturition. I convinced myself of the presence of a foreign body in the bladder by a sound. The patient was given a very warm, prolonged bath, and the bladder several times washed out with a boric acid solution. I injected into the tissue around the urethra a four per cent. solution of cocaine in two per cent. carbolic acid water, until a grain of cocaine was consumed. After this I began dilatation with Simons' urethral dilators—set of seven, the smallest being ¾ cm. in diameter, the largest 2 cm. (¾ inch) and 6.3 cm. (2½ inches) in circumference. As the first dilators passed without trouble, I omitted the otherwise practiced incisions at the orifice of the urethra. For Nos. 5 and 6, one and a half minutes, and for No. 7 two minutes were sufficient, dilatation being completed in six minutes, and the patient suffering no pain. The forefinger was easily introduced, but at first nothing felt. When I turned the hand to explore that portion of the bladder which is attached to the pubic bone, I came in contact with one branch of the pin, which was firmly pressed into the wall of the bladder. Some manipulation, aided by the other hand from without, succeeded in dislodging the pin and bringing it down. To my dismay I found that the double open end of the pin presented. I wished for more fluid in the bladder, but did not want to withdraw the finger that I might inject more, for fear of causing unnecessary pain. The bladder had firmly contracted over the other end of the pin and the attempts at turning were fruitless. I decided, therefore, to bring the pin out point first, and succeeded in gradually working both points below my finger, which was now firmly grasped by the sphincter, into the neck of the bladder. Putting a corner of the finger nail over one point and pressing the other against the wall of the bladder with outside hand, and moving the forefinger carefully outward and inward, I succeeded in engaging the pin in the urethra. Keeping up rotary and up-and-down movements, pressing always from without, both points came soon into view, when I grasped it with a pair of forceps and removed it along with the finger. Nine minutes accomplished the removal.

The pin was of the large, straight, old-fashioned kind, three inches long and very little corroded. The urethra contracted at once, hemorrhage being almost nil and no tears seen. No incontinence followed. The bladder was washed three times a day for two days with a solution of borax and boric acid. The urine became normal and the patient was discharged well.

---

SETTLED.—"The whole question can be settled by one word," said the man who thinks Bacon wrote about everything we know of except After the Ball.

"What word is that?"

"Hamlet." There's the whole cipher wadded up into the title of that one play."

"I don't quite follow you."

"Of course you don't. That's what makes it a cipher, you see. You have to study it out. Now I've studied it. Anybody with an idea of the construction of the English language can see that 'Hamlet' is a diminutive of 'Ham.'"

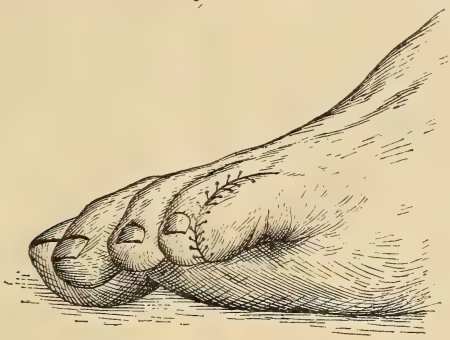
"Y-yes."

"So, instead of using his own name, Bacon used the very next thing to it, and there you have the whole business just as plain as day."—*Washington Star.*

## A NEW METHOD OF CURING INVETERATE SOFT CORNS BETWEEN THE TOES*

A. M. PHELPS, M. D.,† New York.

We all frequently meet with cases of soft corn, occurring particularly in the working classes, between the toes. They are extremely painful, crippling the patient and rendering life almost unendurable. These cases come to the hospital and ask to have the toes amputated. Such corns are usually treated conservatively,



and are cured, but immediately relapse. Deep sloughing ulcers are frequently seen.

A simple procedure which I have followed many times during the past few years answers admirably and saves the toe. It consists in removing all of the soft tissues on the inner side of two of the toes, removing the corn, and stitching the two toes together, as seen in the figure. This procedure does not in the least impair the usefulness of the foot; whereas the removal of the toe must necessarily do so to a certain extent.

Patients upon whom I have operated in this manner have expressed themselves as entirely satisfied, and I am certain that if I had a soft corn that caused me much trouble, I would have no hesitancy in having the operation performed, and the toes "webbed." The nail of the little toe should be removed.

* Presented at the Meeting of the Orthopædic Association in St. Louis, September, 1893.

† Professor of Orthopædic Surgery, University of New York; Professor of Orthopædic Surgery, New York Post-graduate School and Hospital; Professor of Surgery, University of Vermont; Surgeon to Charity Hospital; President of the American Orthopædic Association.

## LINCOLN ON MARRIAGE.

"In some respects," said the gentleman referred to, "Lincoln's memory suffers by reason of his having been the king of wit. There are those who think he never said anything serious. I cannot understand how such an impression exists, but I know it does. Why, he was one of the greatest philosophers I ever heard, and his philosophy was always modestly put, but at the same time he was always so sincere in it that he was at times almost solemn.

"I remember on one occasion he was talking about marriage, a subject in which he always took the most profound interest. He said that every man who contemplated marriage should stand over a doctor with a club and make him tell the truth in reference to the chosen partner for life, if there were no other way of getting it out of him. And he went further. He declared that the parents who would allow a girl to marry a man without knowing as nearly as could be known his physical as well as his moral condition deserved to be scalped. In his opinion the whole marrying business was wrong.

"He declared that fashionable girls too often were cursed with foolish mothers, who cared for nothing but to see their flesh and blood sold to the highest bidder. There was nothing funny in that sort of talk, was there? It ought to be framed and hung up in every home in the land. How few men knew the deeps of that master of men. What a loss to the world that he should have been taken away from it at the time when he was just being understood."—*Chicago Tribune.*

# SOCIETY REPORTS.

## PHILADELPHIA ACADEMY OF SURGERY.

*December 4, 1893.*

Dr. John B. Deaver read

### REMARKS UPON THE TREATMENT OF STRICTURE OF THE SIGMOID FLEXURE AND OF THE FIRST PORTION OF THE RECTUM.

(See page 1005).

#### DISCUSSION.

THE PRESIDENT: I have recorded the following case in several places: Years ago I attended a gentlemen who, as a result of disease of the cervical medulla, was thoroughly paralyzed. Every day the intestines would fill with flatus, and I would introduce a tube beyond the sigmoid flexure and allow the gas to escape. This could be done in this csse without the slightest difficulty. I do not know whether or not the relaxation from the paralysis had anything to do with it. I have tried to repeat the procedure since in the living subject, but have not succeeded. I have also read in some French authorities that it is impossible.

DR. THOMAS G. MORTON: I have knowledge of two cases of rectum perforation, neither of which was in my practice. The first case was a female of sixty or more years of age, who had been subject during the greater part of her adult life to constipation, for which enemata and mild laxatives gave relief. For a month or two before her death this condition had become more troublesome, and relief only partial; a digital examination by her physician, who pronounced double stricture with fecal accumulation and advised bougie dilatation; and shortly afterward made an attempt at digital stretching, which was followed by the introduction of a tube and enema. An hour later the patient went into shock, and then profound collapse, and died forty-eight hours later. The autopsy showed an organic structure, and a perforation of the bowel and general peritonitis, the injection having been thrown into the abdominal cavity.

The other case was a very similar one, intense pain followed the use of the dilator and injection, and the patient died very shortly of peritonitis. I have, however, treated very many strictures at the location mentioned by Dr. Deaver, where much relief was afforded by the use of bougies.

DR. T. S. K. MORTON: The reader of the paper stated that he had found a capacious rectum, and said that he believed that possibly the distention and weakening of the rectum were due to the frequent use of enemata. I call to mind an article by Mr. Thomas Bryant, referring to stricture of the rectum, in which he spoke of "balooning" of the rectum as one of the symptoms. He regarded it as almost diagnostic of stricture. Mr. Bryant offered a number of theoretical explanations for the condition, all of which I do not at the moment recall. One was atrophy, from interference with nutrition; another, the retention of gas. He did not mention the possibility of its resulting from the use of enamata.

DR. DEAVER: I was especially desirious of reporting this case, as the perforation was made by a soft instrument—much more flexible and soft than is used by most surgeons. It is only in recent years that I have been induced to use the soft instrument. I was surprised to have a result of this kind with an instrument which will double on contact with the hands.

I recall the paper of Mr. Bryant to which reference has been made. I have noticed this ballooning of the rectum in many cases, and in some cases of acute mechanical intestinal obstruction from plastic peritonitis, appendicitis, etc. It seems to be associated with obstruction of the bowel, and perhaps in my case it was a consequence of the stricture; but I think that it is bad practice to use enemata at the rate of three a day, for fear of bringing about an atrophic condition of the bowel. In my paper I advise against the use of instruments in the rectum, as the finger is the best instrument; but beyond the second portion of the rectum we are not able to discover a stricture with the finger, and we must use a bougie. These are difficult cases to diagnose, and there is

always an element of risk in the use of a bougie.

---

William G. Porter, M. D., read a

REPORT OF A CASE OF TETANUS.

Helmer E., aged twenty-three years; nativity, Sweden; occupation, machinist; weight, 214 pounds; height, six feet two inches. Patient presented an excess of adipose tissue; skin and mucous membranes pale; had had pneumonia in 1892; was addicted to the use of alcohol, especially beer.

He was brought to the Philadelphia Hospital on the fourth day of the disease at 1 A. M., November 11, 1893, with the history of having run a rusty nail in the sole of his foot, two weeks previously, while working in a cellar.

The wound gave no trouble, healing in a few days. Ten days after the injury, he noticed some pain upon swallowing. The next morning his jaws were stiff, by evening he could not open his mouth, his back was stiff and the seat of severe pain, which he described as feeling like a band of constriction, passing from the back around the abdomen and down into the legs. Upon admission the jaws were firmly locked, the masseters hard, risus sardonicus present. There was a moderate degree of continuous opisthotonus, the abdominal muscles were board-like, and when lifted from the stretcher to the bed he moved as if made of one rigid piece, there being no motion in any joint from his head to his feet. Paroxysmal spasms occurred every one to three minutes, increasing the contractions of all the muscles involved in tonic spasm.

His pulse was soft and rapid, heart-sounds weak, temperature, 99°; bowels had not moved for three days. An evacuation was secured by means of croton oil and a laxative enema. A little ether was given and a free and deep incision made where the punctured wound had been, it was thoroughly cleansed with bichloride (1:200) and a wet bichloride dressing applied. He was placed upon the combined bromides gr. xlv, with chloral gr. xv, every three hours. Nitro-glycerine gt. j. every fifteen minutes till three doses were given, then every hour till there was flushing of the face, then every two hours.

Urinalysis showed a high colored urine, specific gravity 1033, a decided ring of albumin, an excess of chlorides, and a few granular casts.

The full effect of the chloral was not secured till the third day after admission, when there was given by the bowel during the afternoon ʒij of chloral with ʒv of bromides. He now slept soundly, and during the sleep there was less arching of the back and some relaxation of masseters. The paroxysmal spasms, however, did not seem to be influenced by the chloral. Its use by the bowel was continued, giving it in such doses and at such intervals as seemed indicated.

A free perspiration marked the entire course of the disease.

Within a few hours after admission the temperature became normal, and remained so till the seventh day, when it began a slow but continuous ascent.

Feeding was not difficult, the nozzle of the feeding cup was placed between his lips and the contents found their own way to his throat, frequently, however, causing repeated spasms of the pharyngeal muscles. For the first few days he was eager for milk, and five pints were given daily, later he did not care for nourishment, but continually craved beer. Eggs were given in milk and with sherry wine.

During the seventh day of the disease there was much less pain in the back. There was considerable less spasm, patient expressed himself as feeling much better. His mind had been perfectly clear up to this time, but during the night there was a little delirium, and a slight tendency to pick at the bed clothes.

Eighth day: Lower jaw drops a a little during sleep, head not thrown back, paroxysms frequent but not severe. During the night considerable of delirium and some twitching of muscles and carphologia.

Ninth day: All continuous spasms had disappeared, mouth open, and a guard was placed between the teeth to protect the tongue being bitten during the paroxysms, which were marked by prompt snapping of the jaws. At 5.30 P. M. he had a prolonged and severe spasm, after which there was great muscular relaxation; urine and feces were passed involuntarily, respirations became very shallow, no radial pulse could be felt, and he became profoundly unconscious.

At noon his temperature had been 104°; at 5.30 it was 106°; at 6, 107°; at 6.30,

108°; at 7, 109°. At 7.20 the heart ceased beating. Shortly after the cessation of respiration, one-half hour later, the temperature of the body was 111°. Antitoxine: Upon the evening of the seventh day the administration of antitoxine was begun. It was deeply injected into the muscles of the thigh twice daily in ascending doses. The first dose was 20 centigrammes, the last dose 160 centigrammes.

This treatment appeared to have no influence upon the symptoms. There were no local effects at the points of injection. The temperature had begun to rise before the first dose was given.

A post-mortem examination was not secured by the hospital authorities, but was, however, secured after the removal of the body. The membranes of the brain and cord were found intensely hyperæmic; the brain œdematous; the ventricles and central canal of the cord were distended with fluid. The brain and cord are preserved for further examination.

Heart flabby and relaxed. The blood in the auricles and great vessels was dark and fluid. Nothing noteworthy found in other organs.

For these notes and her untiring care of the patient, I am indebted to my very efficient resident, Dr. Emma J. Lucas. And for the opportunity of using the anti-toxine to Drs. Wm. E. Hughes and Carter, who furnished the material and made the injections.

DISCUSSION.

Dr. John B. Roberts: I have been much interested in Dr. Porter's account of the unsuccessful use of antitoxine in acute tetanus. I am inclined to believe, from what I have read, that most of the cases that have recovered have been mild cases, and that the more severe cases have not shown any very brilliant result from the use of such treatment.

Dr. Thomas G. Morton exhibited a patient aged twenty-two months on whom he had operated for

EQUINO VARUS WITH DISLOCATION OF THE ASTRAGALUS,

where he had removed the astragulus from each foot.

Dr. John B. Deaver exhibited a patient showing the result of operation for the

RADICAL CURE OF HERNIA BY BASSINI'S METHOD.

The operation was performed October 12th on account of temporarily irreducible hernia and the inability to properly control the hernia by a truss. This operation has the advantage of not confining the patient to bed for a long time. It consists practically of making a new inguinal canal. The hernia is exposed and the spermatic cord separated from the sac. The hernia is reduced and the sac tied off close within the abdominal cavity and the redundant portion cut away. The internal oblique and transversalis muscles, with the rectus, are then stitched to Poupart's ligament, the cord placed over these muscles, and the skin and superficial fascia over the cord. He used buried sutures of silkworm-gut, which were allowed to remain.

Dr. James M. Barton: On several occasions I have started to perform Halstead's or Bassini's operation, but when I have gotten to the ring I have found the hernia so old that there was practically no canal, one ring lying directly over the other, and as it seemed to me impossible to perform either of these operations, I have performed the MacEwen operation. In my earlier MacEwen operations I cut off all but four or five inches of the sac, when it was very long, fearing there might be sloughing if I retained it all; but in the latter operations I have used the entire sac, even when a foot long. I would ask Dr. Deaver if in these cases of large hernia, where the two rings practically correspond, he makes any attempt to do Halstead's or Bassini's operation.

Dr. J. B. Deaver: In answer to Dr. Barton, I would state that I have done very few of the Bassini operations, but in such cases as Dr. Barton mentions I have done Barker's operation, without, however, obtaining a permanent radical cure. This operation consists principally in tying off the sac at the internal abdominal ring. As Dr. Barton has pointed out, I think there would be some difficulty in doing Bassini's operation.

---

It is not good enough to have a sound mind; the principal thing is to make a good use of it.—*Descartes.*

ISSUED EVERY SATURDAY

ADDRESS

Care P. O. Box 843, Philadelphia.

HAROLD H. KYNETT, A. M., M. D., Editor.

RODERIC C. PENFIELD, Publisher.

147-49-51 North Tenth Street,

PHILADELPHIA.

**TERMS:**—Three Dollars a year, strictly in advance. Sent four months on trial for $1.00.

**REMITTANCES** should be made payable only to the Publisher, and when in sums of Five Dollars or less, should be made by Postal Note, Money Order or Registered Letter.

**NOTICE TO CONTRIBUTORS:**—We are always glad to receive articles of value to the profession, and when used they will be paid for, or reprints supplied, as the author may elect. Where reprints are desired, writers are requested to make a note of that fact on the first page of the MS. It is well for contributors to enclose stamps for postage, that the articles may be returned if not found available.

SATURDAY, DECEMBER 30, 1893.

## EDITORIAL.

### RETROSPECTIVE.

The passing year records many interesting and important events. In every branch of human interest there have developed new phases of old questions, new conditions to be satisfied or new problems to be studied and solved. In each branch there are recorded successes and failures. As the chronicles are closing, the optimist gazes through his telescope, leveled high above the present, and announces the near approach of a millenium; the pessimist immerses his lense in "pure cultures" of the filthiest of human dejecta, and by artificial light and high-power eye-piece detects some pathogenic germ in the body-politic and predicts speedy dissolution; while the thoughtful man with common sense, studying the past to prevent the future, discerns the balance on the right side, and with renewed courage pushes on for greater results. The world has grown no worse this year.

In America, A. D., 1893, will be memorable for magnificence and for misery. The Columbian Exposition witnessed the marvelous achievements of human genius. A beautiful vision of work performed was that White City, which was and is not, in a gloomy setting of business disaster and helpless misery which is and was not. Myriads of sight-seers striving to view life and myriads of unemployed struggling to sustain life. The World's Fair and the financial palsy have made the most marked impressions.

In medicine, the year has shown a steady and decided advance. Not indeed, as viewed from the financial standpoint of the individual practitioner, for the doctor's cash account is confessedly the most sensitive barometer of financial weather—the first to shrink before the coming storm and the last to rise in clearing weather. But from the standpoint of the profession the advance is positive and firm. Efforts to raise the standards of medical education and to require evidences of ability on the part of the applicants for license to practice, have met with public approval, and medical practice acts have been enacted in various states.

In the few as yet unenlightened com-

monwealths vigorous agitation is continued and gives promise of results in the near future.

The great schools now require a four-years, graded course. Smaller institutions will eventually reach this level or go of business.

The market for "chairs" in the larger schools is at present dull, it not being the season for state appropriations. The outlook for the spring trade is promising.

The threatened epidemic of cholera has proved an unmitigated blessing to public and preventive medicine. It has furnished a most efficient national quarantine system which displayed its value in dealing with the Yellow Fever scourge at Brunswick, Georgia. It stimulated the city fathers of large cities to effect municipal cleanliness beyond anything heretofore known. It aroused general attention to the necessity of public and private hygiene, and the results are evident improvements. If the people can be made to realize that more deaths annually result from infectious diseases having a permanent residence in this country than have occured in any epidemic scourge that has yet visited us, scarletina, diphtheria, tuberculosis, typhoid fever, la grippe, *et id genus omne* will be relegated to the limbo of small-pox.

Surgery has still usurped an undue proportion of medical attention, but the tendency now is to digest the immense amount of material swallowed rather than ask for more. Experience is busy settling values, sifting out the useful from the useless, accepting the first, rejecting the latter. It is being realized that antisepsis is not an unmixed blessing, and results are coming to light which show that if surgical cleanliness has wonderfully reduced mortality in older procedures, it has also stimulated 'priority seekers' to a rashness detrimental to their victims.

General medicine has suffered from this furor operandi and too little study has been given to general disease, which, after all, is of paramount importance to the profession at large. The reaction is healthy and progress in this line will be more evident in the near future.

The investigations of pathologists are slowly but surely yielding results that go far to place medicine on the level of a science. Pathology is really in its infancy, but it gives promise of marvelous achievement as it grows older.

Materia Medica has received a few useful additions among the proffered vagaries of manufacturers who desire to lead our Israel into a promised land flowing with milk and honey specifics.

The medical press has labored and brought forth a numerous progeny, mostly still-births but some which will survive and obtain a position in medical literature.

Medical societies have flourished as never before, and the free exchange of ideas thus afforded is of inestimable value to the profession and its ward, the public.

The closing year has shown a marked increase in knowledge and decided improvement in method in the profession and practice of medicine which guarantees greater progress in the coming year.

---

Functions of the Stomach.—The conclusions are:

1. The passage of the contents of the stomach into the intestine occurs at intervals through rhythmical opening and closing of the pylorus.

2. Fluid leaves the stomach more rapidly than more solid food. The (empty) stomach absorbs no water. While the water of sodawater is not absorbed by the stomach the carbonic acid is absorbed in large quantities.

3. Alcohol is absorbed in large measure by the stomach.

Sugar (grape, milk, cane, maltose) in watery solution is absorbed in moderate quantity by the stomach, in alcohol solution, in somewhat larger quantity. Dextrine, as well as peptone, is absorbed by the stomach.—*Centralblatt f. klin. Med.*

# ABSTRACTS.

## THE PHYSICIAN IN RELATION TO COURTS OF JUSTICE.

S. J. MONTAGUE, M. D., WINSTON, N. C.

In looking for a subject of interest in the department of State and Legal Medicine, I find two living and ever-present conditions confronting us—matters which affect and should interest every physician in the State, whether he practice in the largest city or in the most remote country district, whether he keep up with the latest information and fashions of practice, or be content to practice as he graduated, he should, for his own comfort and well-being and the honor and dignity of his profession, know something of his duties and privileges in a court of law. My reason for bringing these matters before the Society is that in certain instances the duties are so ill-defined by practice, and the privileges are so few, that I wish the earnest consideration and discussion of the conditions and expression of opinions in regard thereto.

The first condition to which I would call your attention is that in this State a communication, even of the most sacred and private nature from patient to physician, is not privileged. Privileged communications are those which, on grounds of public policy, courts decline to receive for the reason that their admission would entail greater mischief than their rejection, because of some collateral evil to third persons or to society in general. Where lives the physician who has not had communications made to him by patients to enable him to prescribe intelligently for them, who would not for any consideration disclose the communications. Yet, in the present state of the law, any one refusing on the witness stand to answer all questions, would be guilty of contempt of court and subject to fine and imprisonment at the discretion of the judge. I believe that there are not many members of this Society who would not prefer to suffer fine and imprisonment rather than stand before the community properly dishonored for disclosing confidential communications and exposing their patients to shame and to be the jest of the vulgar crowd. The idea very generally prevails that we have this needed protection at common law, the same as is enjoyed by attorneys; indeed, two well-informed lawyers told me that this was the law, so reasonable and just did it appear. Lawyers have enjoyed this immunity from time immemorial, but physicians, spiritual advisers, and others, have it only by special statute. The Roman law protected physicians against disclosure of confidential communications, and in France it is a crime for a physician to divulge them. Many States of our country have enacted statutes making confidential communications privileged, and, so far as I know, the enacting of these statutes, so necessary for the good of society, has not been resisted. The statute of New York is in these words: "No person duly authorized to practice physic and surgery shall be allowed to disclose any information which he may have acquired in attending any patient in a professional character, and which information was necessary to enable him to prescribe for such patient as a physician or to do any act for him as a surgeon." This, with slight modifications, has been enacted in the following States and Territories: New York, Arizona, Arkansas, California, Idaho, Indiana, Iowa, Kansas, Missouri, Montana, Nebraska, Nevada, Ohio, Oregon, Utah, Washington, Wisconsin, Wyoming, Colorado, Michigan, and Minnesota.

I find, from "Greenleaf on Evidence," that the statutes of nearly all these States limit the privilege to such persons practicing physic and surgery as are duly authorized or licensed, thus very properly making a difference between regularly qualified physicians and irregulars, quacks and such like. It is held that these statutes extend protection also to personal representatives of deceased persons: "The purpose of the laws would be thwarted and the policy intended to be promoted thereby would be defeated if death removed the seal of secrecy from the communications and disclosures which a patient should make to his physician."

Consulting physicians and partners in the same office or practicing together in the same case, enjoy immunity under these statutes. Without the protection of a statute let us see how it would be with a physician called to see a woman bleeding to death after a criminal abortion, and what physician of much experience who has not had such cases? The patient, with danger of death impending, if the condition be not self-evident, makes a clean breast of the trouble to enable the physician to treat her to the best advantage, which having done, no matter in what way the case terminates, his next obligation is to report a crime to the prosecuting attorney or coroner, as the case may be, failing in which, he renders himself liable to prosecution for misprision of felony—concealing a crime. Who can contemplate with equanimity the physician having finished his professional work, now putting on the character of an informer, and leaving his patient in a worse condition than when she called him? Aside from the code of ethics, founded on the golden rule, and which must govern as honor abides with physicians, no one who would do this mean act could live in a decent neighborhood. What, then, must be done? I feel there will be no doubt in any reasonable man's mind as to the course to pursue. Duty, humanity, and innumerable well-made precedents say relieve your patient and hold fast against the world her confidences, but demand, for the sake of humanity, and not as a personal privilege, for the physician does not need it, that this common law injustice be superseded, as early as practicable, by the enactment of a prohibitive statute with proper penalties.

Having considered what a physician may not be allowed to disclose, it is now in order to discuss what he may say and the manner of giving testimony. As it is harder to open the mouth in wisdom than to keep silence, so this subject is more dificult than the preceding. Probably at no time does the average, conscientious physician appear at more disadvantage, and oftentimes have himself unjustly lowered in the eyes of the community than when on the witness stand, exposed to the cross-examination of opposing counsel. From the nature of his calling the ordinary doctor is not prepared to stand the ordeal of the witness-stand. Unused to controversy, rarely meeting his fellows even, in friendly discussion, and accustomed to giving arbitrary orders, and being obeyed without question, he gets little or none of the friction so necessary to enable him to stand with quiet ease the onslaught of counsel whose reputation and the life of whose client may depend on the doctor's discomfiture. It not infrequently happens that physicians of ability fail to acquit themselves in court to their satisfaction, while quacks, from the nature of their business, trained to withstand attacks and criticism, often leave on the unprofessional mind a good impression.

As physicians may be and are called to give evidence in court the same as other people, it is only intended to consider them here in the character of experts. Expert evidence is defined as "that given by one expert and specially skilled in the subject to which it relates or is applicable, concerning information beyond the range of ordinary observation." From this definition it is evident that, while it might not be judicious or in good taste for all physicians to set themselves up as experts, yet all properly qualified doctors are liable to be called as witnesses in this character, and now commences the trouble and question which has vexed and harassed physicians, perplexed courts and confused juries, and no doubt has often brought discredit on expert testimony, both to the profession and to the laity. The need of some change in the manner of procuring and giving this testimony is recognized, but as yet no remedy is at hand. That expert evidence is necessary for the proper administration of justice is admitted, and it is apparent that, without the help of skilled scientists, the detection of the most insidious forms of murder would be difficult, if not impossible. It appears that much study and thought, at various times, has been given to the matter of securing a better system than that which we have at present and which has been in vogue a long time, but whatever has been suggested is liable to abuses and dangers as is the present system. Almost the first idea that occurs to most people thinking about this matter is the selection of the expert by the authorities connected with the case, who, it is assumed, would choose only the most competent, but granting the best of motives to the fairest-minded officer, it must be admitted that he is sel-

dom competent to judge of expert qualifications, and it seems only just and fair to let parties to a trial have every chance possible, which they could not have if experts could only be chosen by the authorities, and especially is this true when it is considered how the authorities are constituted. So it seems that until a more perfect system is evolved or elaborated, we must continue to see and hear conflicting and distressing testimony of scientific experts. The trials recently in New York of Harris, a medical student, and Buchanan, a physician, both charged with and convicted of, murdering their wives with morphine, have brought the matter of expert medical testimony prominently before the world. In the case of Harris, it seems that the prosecution relied principally upon the well known physiological effects of the drug, while in the case of Buchanan the reliance was mainly on the ascertained presence of morphine in the body which was declared to be present by no less specialists than Drs. Witthaus and Doremus. The defence then introduced Prof. Vaughn and Dr. Scheele, who testified and proved by actual illustrations before the court and jury, that color reactions identical with those found by the experts of the prosecution could be produced from ptomaines resulting from the decomposition of animal matter, and consequently that the persecution had not proven the existence in the body of the deceased of morphine. They also contended that only the actual isolation of crystals of morphia in a decomposing body would be sufficient evidence of its presence. The prosecution experts were, it seems, unhorsed, and had the color reactions for the proof of the presence of morphia been all, no doubt there would have been a failure of conviction. Dr. Scheele stated that these color tests used by the experts of the prosecution were not to be depended on, and were not now accepted by the most advanced Germans. This, however, is no new theory or statement, for certainly as far back in 1878, in the trial of Chantrelle, in Edinburg, for poisoning with opium, objection was made to the expert testimony that no opium was found in the body of the deceased, which was admitted, but evidence of morphia was found by color tests on the stained sheets on the vomited matter, but no crystals were found. It was held, then, and is held now, by the best writers on medical jurisprudence that the color reactions for the detection of morphine are more valuable than the slender prismatic crystals found under these circumstances which have no peculiar or definite form, and must be proved at last to be morphia, if they are, by these very color reactions. At this trial the prisoner, Chantrelle, was convicted and executed, the court regarding the objection to the color test as frivolous, and setting it aside. See "Taylor's Medical Jurisprudence, Eleventh American Edition, 1892." The ptomaine theory had not then attained to any notice nor is it now accorded the place it deserves in standard writings, if Prof. Vaughn's experiments are well founded, which they seem to be, and at any rate the prominence and importance attached to them at recent trials, and other places demand that thorough investigation by competent chemists be made and the claims either disproved or accepted and established. The contradictory evidence of scientific experts of international repute inevitably discredits such testimony, confuses medical men and imperatively calls for a revision of the analytic processes for the detection of organic poisons. No doubt the agitation of these matters will arouse the chemical talent of the profession, and before long definite and certain procedures to meet these cases will be established.

Probably the first case the average doctor will be called upon to give expert testimony in will be a coroner's inquest, and there is reason for believing that the dignity and importance of this legal proceeding is not sufficiently appreciated. It should, however, be borne in mind by the physician giving testimony at these inquests (it may be only in the presence of ignorance and oftentimes excited people) that his *words* are taken down, and he may be examined on the same at a higher court and in the presence of the most learned lawyers and physicians. If it is thought that death has not been due to natural causes, the medical witness should refuse to give an opinion without an autopsy, and even then when a sufficient cause of death is not found, as a conjectural opinion is liable to lead to unpleasant responsibilities. It is thought best for medical witnesses not to quote standard writers, but to confine themselves to

facts within their own knowledge and experience. Should he quote so-called authorities, the other side would be allowed to quote in rebuttal, and a controversy of books without end might be brought on. A judge can at his discretion rule out all medical books as evidence. Medicine being a progressive science, the authors of the best text-books are not recognized as authorities, except by courtesy and common consent of the profession, as long as they serve best the purposes for which they were intended. Thus, what is good authority one day may not be the next, not having in the profession any corporate body to make and unmake standards. A physician, in giving evidence before a court, should not base his opinion as to the cause of a death on any one fact, unless that one be amply sufficient, but should take all of the known circumstances of the case into consideration —symptoms before death, chemical analysis, autopsie appearances, as well as the moral aspect. All these working in harmony to the same conclusion would form a good basis for an opinion as to the cause of a death. As a matter of course, the expert is looked upon as more than an ordinary witness. More respect and consideration is his due and more responsibility attaches to him, consequently his demeanor should accord with this idea. Called to testify to the truth, to the best of his knowledge and ability, and he should be well prepared on his subject in all its bearings, and refuse to be led into matters with which he is not perfectly familiar. It would seem that for witnesses occupying the dignified and responsible places of scientific experts intentional ex-parte testimony would be out of place, and there is good reason to believe that when men are governed solely by the nobler instincts of human nature, desiring truly in trials to discover only the truth, that much of the reproach and perplexity of scientific expert testimony will have vanished.

My object in presenting this subject to the Society is to draw attention to the unsatisfactory standing and discredited evidence of physicians in the courts, in the firm belief and hope that, once realized, the profession will be equal to the occasion, and that there will be a desire for reform promoted and a higher stand taken for the rights, the honor and the good name of a profession whose highest purpose is to benefit humanity.

---

**The Rev. Dr. Talmage on the Country Doctor.**

"Our country physicians have so many hardships, so many annoyances, I am glad they have so many encouragements. All doors open to them. They are welcome to mansion and to cot. Little children shout when they see them come down the road, and the aged, recognizine the step, look up and say, 'Doctor, is that you?' They stand between our families and the grave, fighting back the troops of disorder that come up from their encampment by the cold river. No one hears such thanks as the doctor hears. They are eyes to the blind, they are feet to the lame, their path is strewn with the benedictions of these whom they have befriended. One day there was a dreadful foreboding in our house. All hope was gone. The doctor came four times that day. The children put away their toys and all walked on tiptoe, and at the least sound said 'Hush!' How loudly the clock did tick, and how the bannister creaked though we tried to keep so still! That night the doctor stayed all night. He concentrated all his skill upon the sufferer. At last the restlessness of the sufferer subsided in a calm, sweet slumber, and the doctor looked up and smiled; 'The crisis passed.' When propped up with pillows, in the easy chair, she sat, and the south wind tried to blow a rose less into the faded cheek, and the children brought flowers—the one a red clover top, the other a violet from the lawn —to the lap of the convalescent, and Bertha stood on a high chair with a brush smoothing her mother's hair, and we were told in a day or two she might ride out, joy came back to our house.

"And as we helped the old country doctor into his gig, we noticed not that the step was broken, or the horse stiff in the knees, and we all realized for the first time in our life what doctors were worth. Encourage them. They deserve every kindness at our hands."

---

He—"What is the difference between the admission to a dime museum and the admission to Sing Sing?"

She—"Don't know. What?"

He—"One is ten cents and the other is sentence. See?"—*Truth.*

# PERISCOPE.

IN CHARGE OF WILLIAM H. BRICKER, M. D., B. SC.

## THERAPEUTICS.

### The Utility of Saline Enemata in Hemorrhage.

Dr. Warman refers to recent improvements in the treatment of patients bleeding to death, and more particularly to the beneficial results of saline enemata. The author enumerates the objections to the intravenous and subcutaneous methods, the principal difficulties in the former being the impracticability and the danger in the use of an excessive quantity, and in the latter the slow absorption of the injected fluid. Being unable to use either method in a case of abortion, the author attempted a rectal injection, which was very successful. Subsequent he treated twenty-eight patients it the same way, most of whom when seen were much collapsed from post-partum inability of the sphincter to retain the solution. This the author overcomes by placing the patient on one side, allowing the solution to flow slowly and then pressing on the cannula through the vagina. In severe cases this trouble was least frequent, as in these he found absorption to take place most rapidly. The author recommends the same treatment in all severe hemorrhages, excepting those from the intestine.—*Therapeutische Monatshefte.*

### The Local Use of Guaiacol.

*Apropos* of an article by Bard on the antithermic properties of guaiacol locally applied, and of which an abstract was published in the *Gazette* for August last, M. Lannois (*Lyon Medical*), published a contribution on the same subject, mainly corroborative of Bard's observations. Lannois, having tried the method in three patients, concludes:

1. Guaiacol locally applied diminishes to a considerable extent the abnormal temperature or tuberculous patients.

2. The absorption of the drug occurs most probably in the skin, and not by the passage of the guaiacol vapors through the lungs.

3. The absorption of the medicament by the mucous membrane of the rectum gives rise to the same reduction of the temperature as when the drug is applied to the skin; this same action has been observed also in the case of creosote.

## MEDICINE.

### Chlorobrom in Sea Sickness.

Dr. Arthur Hutcheson, writing to *The Lancet*, says that he used chloroform in all cases of sea sickness to which he was called while ship's surgeon on a voyage to and from New Zealand. He always gave it in three-drachm doses in the second stage of this distressing ailment, when retching, headache, depression, and sleeplessness were the prominent symptoms, the hour selected for administration being 10 P. M., in order to secure a good night's rest. The results were very satisfactory. The chlorobrom was always retained and was always followed by sleep (generally sound). The patient awoke much refreshed in the morning, with an appetite and able (except on one occasion) to eat and retain something light.

### In Eczema

There are three groups of sequences: 1. Unknown primary changes in the cells. 2. Arrangements to dispose of the adventitious matter from the blood. 3. Altered chemical action in the epithelium—which sequences have certain forms which appear on the surface of the skin, as redness, swelling, papules, vesicles, etc., and desquamation of cells. In the management of eczema three objects are to be specially aimed at: 1. To sterilize the skin. 2. To aid the removal of the adventitious fluid and cells. 3. To help the formation of the new horny cuticle, and to protect the skin during, and for some time after, its formation.—*Ex.*

### The Relation of Syphilis to General Paresis.

Dr. Frederick Peterson states that his study of this subject leads him to submit the following brief conclusions:

1. A history of syphilis is found in sixty to seventy per cent. of cases of general paralysis of the insane.

2. The fact must not be lost sight of that in thirity to forty per cent. of these cases no history of syphilis, congential or acquired, is to be found.

3. Antecedent syphilis is seven to ten times more frequent in general paralysis than in other forms of insanity.

4. Syphilis is therefore to be looked upon as a frequent but not constant factor in its production.

5. But paralytic dementia is not a form of specific disease, not a late syphilitic manifestation, nor is it a form of degeneration dedepending upon the syphilitic poison for its origin.

6. The relationship of syphilis to general paresis lies in the facts that it is a wide spread disorder in all communities, that it weakens the constitution and vitates the blood in many whom it infects, and that the system is thus prepared in many cases for the direct operation of the final etiology factors of general paresis, viz., alcoholism, excessive venery, heredity, and mental overstrain and excitement.

### The Sedative Action of Duboisine in the Insane.

The following conclusions are based upon an extensive experience of this drug, given in continued doses of from 2 to 4 milligrammes:

1. Duboisine reveals itself as a marvellous sedative, capable of combating, always and in all cases, maniacal and melancholic agitation, often substituting an absolute tranquility for the most violent excitement or anxiety; its action presents itself in two degrees, the one incomplete, consisting of a simple attenuation of the exaltation, the other complete, and characterized by the total disappearance of the latter for a time more or less long.

2. The calm induced does not attain its maximum all at once; sometimes this does not occur till the second or third day.

3. Once produced, the calm is maintained very regularly so long as habituation does not manifest itself.

4. The more complete sedative action most often persists one or several days after stoppage of the drug, and often it happens that the calm is prolonged over a fairly long period.

5. In the intermittent and remittent forms of insanity, it is capable of reducing the duration of the attacks and of spacing them out.

6. The sedative action in all its degrees has been in general, particularly in the first days of treatment, in inverse proportion to the length of time that has elapsed since the administration of the remedy; hence the advantage of giving the drug in two doses daily.

7. The complete action occurs much more frequently in chronic than in acute mania, and, on the contrary, in acute than in chronic melancholia, and in a general way, in mania than in melancholia.

8. In general paralysis the complete action is less frequent than in chronic mania and acute melancholia, but more frequent than in acute mania and chronic melancholia, but, on the whole, general paralysis shows itself more sensible to the influence of the drug than the insanities.

9. Habituation occurs very promptly in the insane, is established very suddenly, and is not overcome by increasing the dose.

10. Tolerance is more frequent and more rapid in general paralysis, is more frequent in melancholia than in mania, and does not appear in the chronic forms of insanity.

11. The incomplete action is less frequent in general paralysis than in other forms of insanity.

12. In a general way it may be said that the drug is more active in general paralysis than in the insanities, in mania than in melancholia, in chronic than in acute mania, and in acute than in chronic melancholia.

13. Owing to its action on the stomach, it is well to administer the drug at times the most removed from the two principal meals.

14. It has, unfortunately, a very damaging effect upon the general nutrition, particularly when long continued.—*Glasgow Med. Jour.*

### Treatment of Myxœdema and Cretinism with the Thyroid Gland.

In this paper 100 published cases of myxœdema and 11 of cretinism are reviewed. The treatment by thyroid gland is found to give equally favorable results in both sexes and at all ages. The length of time which the disease has existed makes little or no difference in the treatment. In some cases the improvement occurs with extraordinary rapidity, and the changes brought about in one month or eight weeks are always well marked; but the length of time during which it may be necessary to continue the treatment is a point as yet unknown. Probably it may be necessary to continually give a small dose at more or less prolonged intervals in order to maintain the improved condition. As regards dosage there has been no uniformity, so much depends on the age of the individual, and stage of the malady, and personal idiosyncrasy. The occurence of grave and unpleasant symptoms is noted, attributable mainly to excessive dosage and consequent toxic action, and varying from general weakness, faintness, nausea, vomiting, giddiness, headache, and aching pains in the neck and shoulders, to loss of consciousness, tonic spasms, collapse, urgent dyspnœa, and cardiac failure, while in four cases death resulted.—*Glasgow Med. Jour.*

---

### Multiple Chancres with Fever Treated by Warm Baths.

An anæmic young man, who had a soft sore on the scrotum and a suppurating bubo in the groin, suffered much from itching in the legs, and scratched himself freely; the consequence was the sudden eruption of some 30 chancres on the lower limbs. This was associated with well marked fever, which continued for a week, although the ulcers were daily cleansed with corrosive sublimate solution, and dressed with iodoform. While these sores were in process of healing, a second and more abundant eruption took place over the limbs, buttocks and loins, again accompanied by high fever. and by prostration. Warm baths were employed daily, the temperature being gradually raised, by the addition of hot-water, from 30° to 36° C. The temperature soon went down, and the patient recovered, the ulcers healing in three weeks.

Experimental inoculation of pus from the sores was successfully carried out three times on the patient himself. Culture experiments made from the blood yielded negative results. The fever was looked upon a simple absorption fever.—*Ex.*

---

## SURGERY.

### Cyst of Pancreas.

Dr. Giffen (Nebraska) reports the case of a woman, aged 28, suffering from abdominal tumor, with severe pain for two years, and nausea after food. The abdomen was opened, and the tumor found to be a pancre-

atic cyst. After evacuating three quarts of the fluid, the cyst wall was shelled out down to the body of the pancreas, pulled out and attached by suture to the abdominal wall, as much as possible being cut off, and the rest packed with iodoform gauze. The patient did well; there was slight suppuration, but the wound healed rapidly, except where the cyst wall was attached, where a fistula remained a few weeks.—*Medical News.*

### A New Method of Direct Fixation of Fragments in Compound and Ununited Fractures.

Senn (*International Jour. Surg.*) makes an earnest plea in favor of more frequent recourse to direct means of fixation in compound and ununited fractures.

His conclusions are as follows:

1. Direct fixation of the fragments is indicated in all compound fractures in which perfect retention cannot be secured by simpler measures and in the treatment of ununited fractures requiring operative interference.

2. This method is also justifiable in certain forms of subcuteneous fracture in which reduction and retention cannot be accomplished without it.

3. Free exposure of the fragments in compound fractures secures the most favorable condition for thorough disinfection.

4. Perfect reduction and direct fixation of the fragments are the most reliable prophylactic measures against delayed union, nonunion; and deformity.

5. A compound fracture should be regarded in the same light as an injury to the soft parts, and should be treated upon the same principles.

6. Bone sutures and ivory nails do not furnish the necessary degree of support and immobilization in the direct treatment of fracture.

7. The hollow perforated bone or ivory cylinder devised by the author answers the same mechanical purpose without the objections which have been charged against the solid cylinder. Such cylinders should be made from the shafts of long bones of young animals, such as chickens, turkeys, or rabbits.

8. Fractures not requiring drainage should be closed with buried and superficial sutures.

9. The external splint should be so applied as not to require changing during the entire course of the treatment.

### A New Treatment of Mammary Abscess.

Tweedy (*Medical Press and Circular* adopts Weber's method of treating mammary abscess.

An early and free incision is made in the breast, radiating from the nipple, and situated at the most dependent part of the abscess.

The finger is then inserted into the wound and the gland structure broken down. This manipulation, it is stated, will have no bad effect on the healthy tissue.

By this process several new cavities will be found, and these, in turn, are to be opened by an incision smiliar to the first, and the whole thoroughly douched with some antiseptic solution.

The membrane lining the several cavities is to be curetted, and the *debris* removed by a second douching.

Strips of gauze sufficient to fill every interstice of the abscess are to be steeped in a one-per-cent. solution of carbolic acid, and inserted by means of a long sinus forceps and probe. A large, flat sponge is then placed on the breast and tighly bandaged thereto for twenty-four hours. After this period the dressings are removed, and without further irrigation the cavities are again packed, the sponge and bandage being reapplied as befor.

On the third day process is repeated.

In the fourth dressing the gauze packing is dispensed with and the incisions are drawn together and dressed antiseptically; the sponge and bandage are reapplied.

This last process is repeated every twenty-four hours until healing is complete; this usually takes place about the tenth day. In one of the author's cases the whole process was accomplished without the aid of anæsthesia. In only one of his cases was it necesaary to make a second incision. The incisions are never longer than is necessary to admit a finger.

Iodoform gauze should be used for packing the wounds.

The author only having treated five cases, cannot say definitely what portion of the above treatment is essential, but he is strongly inclined to the opinion that curetting can be safely dispensed with.—*Therap. Gaz.*

## GYNECOLOGY.

### Operations upon the Uterine Appendages With a View to Preserving the Functions of Menstruation and Ovulation.

Polk (*American Jour. of Obstetrics,*) in reading his paper with the above title before the American Gynecological Society, at its session held in Philadelphia, May 16, 17, and 18, 1893, reaches the following conclusions:

1. In case of chronic disease of the appendages the incisions should be in the nature of "exploratory incisions."

2. The question of removal should be in the main left for determination after the organs have been exposed.

3. That the condition of the ovary should be the chief factor in determining the question of procedure.

4. That, if need be, this may be determined by exploratory incision of the ovary or puncture.

5. That if the ovary contains pus, it and the associated tube should be removed, it being the rule that whenever an ovary is removed the tube must accompany it.

6. That if the tube contains pus, the ovary being free from pus or dissemiated cystic degeneration, the operator is at liberty to recommend either the removal of both organs or else the partial amputation of the tube,

leaving the ovary; and that the same rule shall apply in cases of hydrosalpinx and hæmatosalpinx.

7. That cyst of the ovary do not indicate removal, provided they are not general thoroughout the organ and can be enucleated —hæmatoma of the ovary a possible exception.

8. Tubes with open infundibula, even though adherent and affected with parenchymatous inflammation and endosalpingitis do not demand removal, excepting when one opens into a pus cavity.

9. A tube whose outer end is closed may be opened cleansed, and its inner and outer coats coaptated, and then be returned to the abdominal cavity, provided it does not contain pus and possibly old blood.

10. Adhesions do not demand the removal of the tubes and ovaries, unless they be so dense that in breaking them the appendages are seriously injured. This presupposes that the appendages in themselves are not sufficiently diseased to demand removal.

## OBSTETRICS.

### Unconscious Delivery.

Le Blond (*Journ. de Med. de Paris*) related in July a remarkable case before the Medico-legal Society of Paris. A woman, aged twenty-seven, who had been seduced and deserted, was seized with slight colicky pains, but continued to work. In the course of the following night she was attacked with still more severe pain. Thinking that an action of the bowels would give relief, she sat upon her chamber utensil; on straining a live child was born. This alarmed her greatly, but she cut the cord with scissors, wrapped the infant in a cloth and walked downstairs, telling the people in the house, in fear and trembling, what had happened. Violent flooding set in. The cord had not been tied. Early in the morning Le Bond saw the patient, and found the placenta still in the vagina. He extracted it. The mother and child did very well. Had the child died the mother would have been very strongly suspected of murder, especially if she had attempted to defæcate in a public privy, in which case the child would almost inevitably have been killed.—*British Medical Journal.*

## ARMY AND NAVY.

U. S. ARMY, FROM DECEMBER 17, 1893, TO DECEMBER 23, 1893.

Lieut. John S. Kulp, Assistant Surgeon, U. S. Army, is relieved from further duty at Jackson Park, Chicago, Illinois, from December 23, 1893.

Leave of absence for one month, to commence about December 22, 1893, is hereby granted to Major Daniel G. Caldwell, Surgeon, U. S. Army.

Leave of absence for one month, to take effect about the 20th instant, is granted Captain W. B. Banister, Assistant Surgeon, U. S. Army.

Bailhache, P. H., Surgeon; Granted leave of absence for five days, Nov. 28, 1893. To inspect quarantine ports Dec. 7, 1893.

Puvriance, George, Surgeon; to inspect quarantine ports Dec. 7, 1893.

Saweelle, H. W., Surgeon; to inspect quarantine ports Dec. 7, 1893. Granted leave of absence for three days, Dec. 4, 1893.

Austin, H. W., Surgeon; detailed as chairman board, to amend and revise the quarantine regulations, Dec. 9, 1893.

Gassaway, J. M., Surgeon; to proceed to Mobile, Ala., as inspector, Nov. 22, 1893. To inspect quarantine ports Dec. 7, 1893.

Mead, F. W., Surgeon; detailed as chairman board to examine candidates, Revenue Marine Service, Dec. 9, 1893.

Carter, H. R., Surgeon; to proceed to Brunswick, Ga., for temporary duty Nov. 29, 1893. To inspect quarantine ports Dec. 7, 1893. Detailed as member board to revise and amend the quarantine regulations, Dec. 9, 1893.

Wheeler, W. A., Surgeon; detailed as member board to revise and amend quarantine regulations Dec. 9, 1893.

Banks, C. E., Passed Asst. Surgeon; granted leave of absence for seven days, Nov. 22, 1893.

Carmichael, D. A., P. A. Surg.; to inspect quarantine ports, Dec. 7, 1893.

White, J. N., P. A. Surgeon; to proceed to Savannah, Ga. for duty Dec. 4, 1893. Detailed as member board to revise and amend the quarantine regulations, Dec. 9, 1893.

Carrington, P. M., P. A. Surgeon; to proceed to Baltimore, Md. for duty Dec. 9, 1893.

Williams, L. L., P. A. Surgeon; to proceed to Charleston, S. C. for duty Dec. 4, 1893.

Pettus, W. J., P. A. Surgeon; granted leave of absence for eleven days. To proceed to Buffalo, N. Y. for duty Dec. 4, 1893.

Keinyoun, J. J., P. A. Surgeon; to rejoin station.

Washington, D. C., Nov. 24, 1893. Granted leave of absence for three days, Dec. 4, 1893. Detailed as Recorder Board to revise and amend quarantine regulations, Dec. 9, 1893.

Woodward, R. M., P. A. Surgeon; granted leave of absence for seven days. To proceed to Cairo, Ill. for duty Dec. 4, 1893.

Voughan, G. T., P. A. Surgeon; detailed as Recorder Board for physical examination candidates Revenue Marine Service, Dec. 9, 1893.

Cobb, J. O., P. A. Surgeon; to inspect quarantine ports Dec. 7, 1893.

Guitevas, G. M., P. A. Surgeon; to report at Bureau for temporary duty Dec. 6, 1893.

Geddings, H. D., P. A. Surgeon; to proceed to New York, N. Y., for duty Dec. 2, 1893.

Young, G. B., Asst. Surgeon; to proceed to New York, N. Y., for duty, Dec. 4, 1893.

Stimpson, W. G., Asst. Surgeon; to proceed to Detroit, Mich., Dec. 4, 1893.

Brown, B. W., Asst. Surg.; granted leave of absence for seven days. To proceed to Washington, D. C., Dec. 4, 1893.

Houghton, E. R., Asst. Surgeon; To proceed to Vineyard Haven, Mass., for duty, Dec. 4, 1893.

Roseman, M. J., Asst. Surgeon; to proceed to St. Louis, Mo., for duty, Dec. 4, 1893.

# MARIANI & CO.

Paris: 41 Boulevard Haussmann
London: 239 Oxford St.
New York: 52 West 15th St.

## STANDARD COCA PREPARATIONS.

Introduced through the Medical Profession since 1863.

VIN MARIANI (Wine),
ELIXIR MARIANI (Cordial),
THÉ MARIANI (Extr. Fluid),
PÂTE MARIANI (Lozenge),
PASTILLES MARIANI (Lozenge),
(Coca and Cocaine).

Invariably Uniform in Results Since 30 Years.

# IMPORTANT.

NEW YORK, 52 W. 15th St.

*To the Medical Profession:*

Frequent complaints from physicians and patients, regarding disappointment and annoyance caused by imitations and substitutions (so-called "Coca Wines"), compel us to respectfully ask physicians desirous of prescribing **our wine,** to specify **"Mariani,"** and impress on patients to accept only **"Mariani Wine"** (Vin Mariani).

MARIANI & CO.

EXHAUSTIVE MONOGRAPH, DETAILED DESCRIPTION, WITH FORMULA, DOSE, ETC. SENT GRATIS ON APPLICATION.

## MEDICAL DEPARTMENT OF THE COLUMBIAN UNIVERSITY.

WASHINGTON, D. C.

### ANNOUNCEMENT, 1893—'94.

The Seventy-second Session will begin October 1st, 1893, and continue seven months. Graded four year course required. Ample clinical facilities.

FACULTY:

J. F. THOMPSON, Surgery.
W. W. JOHNSTON, Practice.
A. F. A. KING, Obstetrics.
E. A. DE SCHWEINITZ, Chemistry.
WM. P. CARR, Physiology.
D. W. PRENTISS, Therapeutics.
D. K. SHUTE, Anatomy.
H. C. YARROW, Dermatology.
G. B. HARRISON, Pediatrics.
THEO. SMITH, Bacteriology and Hygiene.
T. E. McARDLE, Minor Surgery.
H. L. E. JOHNSON, Gynæcology.
G. N. ACKER, Pathological Histology.
W. M. GRAY, Normal Histology.
W. K. BUTLER, Ophthalmology.
S. RUFFIN, Medical Jurisprudence.
C. W. RICHARDSON, Laryngology and Otology.
A. C. PATTERSON, Mental Diseases.
E. L. TOMPKINS, Neurology.

For circulars, address **A. F. A. KING, M. D., Dean,**
1315 Massachussets Avenue, N. W., Washington, D. C.

## TERRACE BANK SANITORIUM

Dr. R. S. Sutton's Private Institution for the Treatment of Surgical Diseases of Women.

PERFECT SANITARY AND ASEPTIC ARRANGEMENTS, and provided with all Modern Conveniences, Address

**170 RIDGE AVENUE, ALLEGHENY, PA.**

## Sewanee Medical College.

MEDICAL DEPARTMENT OF THE
UNIVERSITY OF THE SOUTH.

A SPRING AND SUMMER GRADUATING SCHOOL.
Three Annual Courses of Lectures required.
Opens March 5th, 1894, and continues six months.
Climate cool and delightful, 2300 feet above sea.
Course full and complete. No extra charge for laboratory instructions. For circulars, address

J. S. CAIN, DEAN,
Sewanee, Tenn.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. MCKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address
DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

## WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

No Saddle is a "Whitman" unless it bears the Company's name-plate and trade mark:

Makers of the celebrated

**WHITMAN SADDLES**

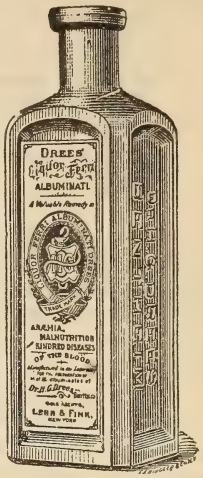
Philadelphia, Pa., U. S. A.

# Liquor Ferri Albuminati. Drees.

**J. P. Grozier Griffith, M.D.,** Professor of Clinical Medicine in the Philadelphia Polyclinic; Assistant Physician to the Hospital of the University of Pennsylvania, says in the course of a lecture on Gastric Affections: "The one which I have employed in this case is the **Liquor Ferri Albuminati,** the solution of albuminate of iron, made by **Drees, of Bentheim, Germany.** It is of neutral reaction, entirely free from metallic taste, does not coagulate albumen, and is usually perfectly well borne by the stomach. Even in cases in which hæmatemesis has recently occured, the use of this preparation is not contra-indicated. The girl of whom I have been speaking, takes it readily. It may be given in doses of 10 drops, three times a day at first, but a much larger amount can later be administered."



*Drees' Liquor Ferri Albuminati* can be obtained of all leading prescription pharmacists in all parts of the United States; all wholesale druggists will supply the article; for further information address the Sole Agents,

# Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

**SALIPYRIN (RIEDEL).**
**ANALGESIC, ANTI-RHEUMATIC, ANTIPYRETIC.** A chemical combination of 57.7 per cent. antipyrine, and 42.3 per cent. salicylic acid. **Dose, ½ to 2 grammes.** Free from cardiac influence and other unpleasant side and after effects. Used with marked success in Influenza, Neuralgia, and all Rheumatic affections.

**THIOL (RIEDEL).**
A synthetically-produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical report sent on request.

**LYSOL.**
"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

**PIPERAZIN (SCHERING).**
**URIC ACID SOLVENT.** Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

**PHENOCOLL (SCHERING).**
**ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE.** "The superior of all coal-tar antipyretics previously introduced. **Dose, 7½ to 15 grains.** Descriptive pamphlet (40 pages) supplied on request.

**CHLORALAMID (SCHERING).**
**HYPNOTIC.—Dose, 15 to 45 Grains.** A full descriptive pamphlet (64 pages) supplied on request.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

**A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.**

## LEHN & FINK,

**Importers, Wholesale Druggists and Manufacturing Chemists,**

ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE** from the brain, for diseases of the brain;
**MEDULLINE** from the spinal cord, for diseases of the cord;
**CARDINE** from the heart, for diseases of the heart;
**TESTINE** from the testes, for diseases of the testes;
**OVARINE** from the ovaries, for diseases of the ovaries;
**MUSCULINE** from the muscles, for diseases of the muscles.

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

THE BEST ANTISEPTIC

FOR BOTH INTERNAL AND EXTERNAL USE.

ANTISEPTIC, PROPHYLACTIC, DEODORANT.

# LISTERINE

NON-TOXIC, NON-IRRITANT, NON-ESCHAROTIC.

LISTERINE is a well-proven antiseptic agent—an antizymotic—especially useful in the management of catarrhal conditions of the mucous membrane; adapted to internal use, and to make and maintain surgical cleanliness—asepsis—in the treatment of all parts of the human body, whether by spray, irrigation, atomization, or simple local application, and therefore characterized by its particular adaptability to the field of

PREVENTIVE MEDICINE—INDIVIDUAL PROPHYLAXIS.

LISTERINE destroys promptly all odors emanating from diseased gums and teeth, and will be found of great value when taken internally, in teaspoonful doses, to control the fermentative eructations of dyspepsia, and to disinfect the mouth, throat, and stomach. It is a perfect tooth and mouth wash, INDISPENSABLE FOR THE DENTAL TOILET.

# Lambert's Lithiated Hydrangea.

FORMULA.—Each fluid drachm of "Lithiated Hydrangea" represents thirty grains of FRESH HYDRANGEA and three grains of CHEMICALLY PURE Benzo-Salicylate of Lithia. Prepared by our improved process of osmosis, it is INVARIABLY of DEFINITE and UNIFORM therapeutic strength, and hence can be depended upon in clinical practice.

DOSE.—One or two teaspoonfuls four times a day (preferably between meals.)

*Close clinical observation has caused Lambert's Lithiated Hydrangea to be regarded by physicians generally as a very valuable Renal Alterative and Anti-Lithic Agent in the treatment of*

**URINARY CALCULUS, GOUT, RHEUMATISM, CYSTITIS, DIABETES, HÆMATURIA, BRIGHT'S DISEASE, ALBUMINURIA AND VESICAL IRRITATIONS GENERALLY.**

We have much valuable literature upon GENERAL ANTISEPTIC TREATMENT, LITHEMIA, DIABETES, CYSTITIS, ETC., to forward to physicians upon request.

**LAMBERT PHARMACAL COMPANY, St. Louis. Mo.**

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :
This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1⅓ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

## SCHERING & GLATZ,

**Sole Representatives in the United States for Chemische Fabrik auf Actien, vorm. E. Schering, BERLIN, Germany.**

**55 MAIDEN LANE, NEW YORK.**

**PAMPHLETS FURNISHED ON APPLICATION.**

# GESTATION.

WHEN women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

I can heartily endorse ALETRIS CORDIAL, after giving it a fair trial. Mrs. F., aged 37, mother of two children, during last seven years has miscarried three times. Has lateral curvature of spine, and was never robust. Began, in last gestation, at four months to give ALETRIS CORDIAL, three-quarter teaspoonful three times a day, and increased to one teaspoonful. She has used four half-pound bottles, and is now within four or five days of full term. Her general health has been much improved, appetite good, no vomiting, bowels in good condition, kidneys acting well. I am exceedingly well pleased with the action of the remedy, as is also my patient. I have also used ALETRIS CORDIAL in ovarian neuralgia, with tip-top results. I have used it in one case of miscarriage at three months, in which the catamenia almost amounted to flooding, confining the patient to bed for six or eight days at a time. In this case I prescribed:

R. Aletris Cordial..... 8 ounces.
Ergot, Fl. Ext. ..... 2 ounces.
M. Sig. Teaspoonful three or four times a day.

This acted promptly, and the next period was passed in comparative comfort.

E. L. FISH, M. D., West Valley, N. Y.

I have much pleasure in expressing my satisfaction with the results I have obtained by the use of ALETRIS CORDIAL. One of my patients who had miscarried three times previously, took ALETRIS CORDIAL during the last three months of pregnancy, and was delivered of a fine, healthy boy. I ordered it at her own solicitation, as she expressed so much ease and comfort after the use of the first bottle. I am now giving it to two more patients, who have miscarried several times before, and am in hopes of good results. I consider it a valuable addition to the Pharmacopœia, on account of its antispasmodic and nerve-tonic properties, and should not like to be without it.

M. D. MAKUNA, M.R.C.S.,
Trebeebut, Rhondda Valley, South Wales.

I used ALETRIS CORDIAL in a case of painful menstruation. It was most valuable. The wife of a minister suffered much, and had had three miscarriages. Prescribed ALETRIS CORDIAL. She has, for the first time, gone her full time, and was safely confined with a male child. I also prescribed it to a relative, suffering with leucorrhea for years. Great relief from pain, and the discharge much less. In the first case related it was truly a God-send.

R. REECE, M.R.C.S. Eng., 1851, L.S.A., 1832,
Walton-on-Thames, England.

I tried ALETRIS CORDIAL on a patient who had twice previously miscarried, and she went to full term. C. T. NUGENT, M. D., Bertrand, La.

A full size bottle of ALETRIS CORDIAL will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

**RIO CHEMICAL CO., St. Louis.**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, Metcalf's Coca Wine acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

170 RIDGE AVENUE, ALLEGHENY, PA.

## Sewanee Medical College.

MEDICAL DEPARTMENT OF THE
UNIVERSITY OF THE SOUTH.

A SPRING AND SUMMER GRADUATING SCHOOL.
Three Annual Courses of Lectures required.
Opens March 5th, 1894, and continues six months.
Climate cool and delightful, 2300 feet above sea.
Course full and complete. No extra charge for laboratory instructions. For circulars, address
J. S. CAIN, DEAN,
Sewanee, Tenn.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address
DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

## WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS. M.D.,
Sup't Walnut Lodge, Hartford, Conn.

## NO WAX

Is used in our **Hollow Suppositories.** Made from purest **Butter of Cocoa only,** which **melts** at the temperature of the **body.** Can be filled with any medicine. Anal, Nasal, Urethral, Cystic, Vaginal, and Intra-Uterine sizes.

Also, Ricord's Solid Suppositories for Gonorrhœa, and Nelaton's Solid Suppositories for Constipation and Piles. Samples sent Free on application and mention of this paper.

HALL & RUCKEL,
218 Greenwich St. New York City.

## Phena Tro Cine

**THE NEW ANTIPYRETIC** and **ANALGESIC,** though of recent introduction, has proven a favorite with all physicians who have used it, in Neuralgia, Sciatica, Typhoid Fever, Acute Rheumatism, Hysteria, La Grippe, and any and all pains due to irregular Menstruation. It reduces temperature quickly and has no depressing effect on the heart or any of its functions.

Kindly write us for a sample, literature and testimonials.
Mailed on receipt of price (437½ grs.), **60 cents.**

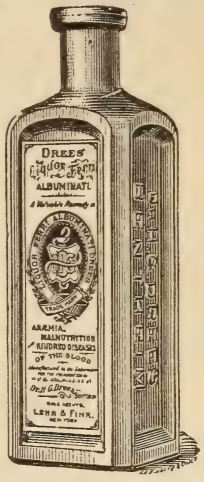
# Liquor Ferri Albuminati. Drees.

**J. P. Grozier Griffith, M.D.,** Professor of Clinical Medicine in the Philadelphia Polyclinic; Assistant Physician to the Hospital of the University of Pennsylvania, says in the course of a lecture on Gastric Affections: "The one which I have employed in this case is the **Liquor Ferri Albuminati**, the solution of albuminate of iron, made by **Drees, of Bentheim, Germany.** It is of neutral reaction, entirely free from metallic taste, does not coagulate albumen, and is usually perfectly well borne by the stomach. Even in cases in which hæmatemesis has recently occured, the use of this preparation is not contra-indicated. The girl of whom I have been speaking, takes it readily. It may be given in doses of 10 drops, three times a day at first, but a much larger amount can later be administered."



*Drees' Liquor Ferri Albuminati* can be obtained of all leading prescription pharmacists in all parts of the United States; all wholesale druggists will supply the article; for further information address the Sole Agents,

**LEHN & FINK, 128 William St., NEW YORK.**

# Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

**SALIPYRIN (RIEDEL).**
**ANALGESIC, ANTI-RHEUMATIC, ANTIPYRETIC.** A chemical combination of 57.7 per cent. antipyrine, and 42.3 per cent. salicylic acid. **Dose, ½ to 2 grammes.** Free from cardiac influence and other unpleasant side and after effects. Used with marked success in Influenza, Neuralgia, and all Rheumatic affections.

**THIOL (RIEDEL).**
A synthetically-produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical report sent on request.

**LYSOL.**
"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

**PIPERAZIN (SCHERING).**
**URIC ACID SOLVENT.** Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

**PHENOCOLL (SCHERING).**
**ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE.** "The superior of all coal-tar antipyretics previously introduced. **Dose, 7½ to 15 grains.** Descriptive pamphlet (40 pages) supplied on request.

**CHLORALAMID (SCHERING).**
**HYPNOTIC.—Dose, 15 to 45 Grains.** A full descriptive pamphlet (64 pages) supplied on request.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

**A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.**

**LEHN & FINK,**
**Importers, Wholesale Druggists and Manufacturing Chemists,**
ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE** from the brain, for diseases of the brain;
**MEDULLINE** from the spinal cord, for diseases of the cord;
**CARDINE** from the heart, for diseases of the heart;
**TESTINE** from the testes, for diseases of the testes;
**OVARINE** from the ovaries, for diseases of the ovaries;
**MUSCULINE** from the muscles, for diseases of the muscles.

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

# *Bedford Springs*

# *Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1893.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

**The Springs Hotel is open from June until October.**

# E. STANLEY HART & CO.

Bedford Mineral Springs Co., Bedford, Pa.

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

# NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of the forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, ***TO INCREASE THE NERVE CAPITAL OF YOUR PATIENT.***

# DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity *when* its supplying nerve is disordered *by lowered tone,* but this fact is largely ignored in these modern pepsin days—the *cause* being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of *the neurotic* patient. Hence, in treating dyspsepia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are *two distinct* ***INDICATIONS,*** one is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

**RIO CHEMICAL CO., St. Louis.**

# Phytoline

## A POWERFUL ANTI-FAT.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF PHYTOLACCA DECANDRA.

**PHYTOLINE** is the only Remdy that will absorb fatty tissue in a great degree without any evil after effects whatsoever. By its powerful though harmless action it replaces morbid tissue with solid flesh.

THIS STYLE ONLY.

FOR OBESITY AND FATTY DEGENERATION OF THE HEART, PRESCRIBE:

℞ *Phytoline (Walker) ℥ II*

**DISPENSED BY DRUGGISTS.**

*For Literature and Clinical Reports, address:*

**WALKER PHARMACAL COMPANY. ST. LOUIS, MO. U.S.A.**

WE CANNOT AFFORD TO DISTRIBUTE SAMPLES OF THE REMEDY PHYTOLINE, AS THE COST TO US IS GREAT, BUT WE WILL MAIL ANY PHYSICIAN ONE FULL SIZE BOTTLE UPON RECEIPT OF THE WHOLESALE PRICE OF $1.00 AND 10 CTS. FOR POSTAGE. WE WOULD SUGGEST HOWEVER THAT YOUR DRUGGIST ORDER A SUPPLY FOR YOUR PRESCRIPTIONS. *A. Lambrecht, del*

# Derangements of the Liver.

## HORSFORD'S ACID PHOSPHATE

has been used with good effect in diseases of the liver and biliary disorders, where an acid treatment is indicated, and has especially proved a desirable medium to employ in chronic hepatic affections. By its action it stimulates the liver and promotes an increased flow of bile.

The Acid Phosphate is far superior to the nitro-muriatic acid of the pharmacopœia, in that it serves to assist digestion, and promotes in a marked degree the healthful action of the digestive organs.

**Dr. O. G. Cilley,** of Boston, says : "I give it in all cases where there is derangement of the liver, with the most remarkable success. With my patients it has agreed wonderfully."

**Send for descriptive circular. Physicians who wish to test it will be furnshed, upon application, with a sample, by mail, or a full sized bottle without expense, except express charges. Prepared under the direction of Prof. E. N. Horsford, by the**

**RUMFORD CHEMICAL WORKS, Providence, R. I.**

**Beware of Substitutes and Imitations.**

# PEPSIN We make the Best

**Why?**
- **We have the Facilities**
- **We have good Chemists**
- **We are Careful**

We have the freshest material (we make pepsin when and where the hogs are killed) on ice within an hour of killing. We are enabled to prevent any septic contamination. These reasons, and our products, put us in the fore—they created and supplied a demand for 30,000 pounds of pepsin products last year, and compel us to increase our present capacity fifty per cent.

## Results Tell

You ask for samples and we send them. You prescribe—we furnish the best pepsin in the market. Quid pro quo.

**THE CUDAHY PHARMACEUTICAL CO.**
**SOUTH OMAHA, NEB.**

# A WORD
## ON
# MALT EXTRACTS

**The Physician's province is not invaded by the solicitation of lay custom for our malt products.**

**Our Malt Preparations are Medicinal Products to be dispensed by the Pharmacist as the Physician shall prescribe.**

A malt extract, properly speaking, is both a nutritive and a digestive—nutritive because of the presence in it of a large percentage of digested starch; and digestive by virtue of the diastase it contains. It should be remembered that in the administration of pre-digested foods the stomach is entirely relieved of the labor ordinarily incident to digestion, and the assimilation of the full quantity of nourishment introduced into the alimentary canal is thus assured. Malt extracts, as regards their digestive power, are valuable or not, according to the care exercised in their manufacture and the amount of diastase which they contain. This, fortunately, is a matter capable of easy determination by estimating the action of a given quantity of any sample upon starch, under conditions similar to those which prevail during natural digestion.

We have devoted much time and study to the subject of digestives and their manufacture, and in introducing to your attention our Malt Extract we do so with the positive knowledge that it is at once a more active digestive and concentrated nutrient than any similar preparation now on the market.

Aside from the digestive and nutritive value of malt extract, its sweetness and palatability make it a valuable vehicle for the administration of remedies possessed of a disagreeable or nauseating taste.

## THE PROFESSION

Is respectfully requested to write for our literature upon malt extract and its combinations, particularly "A Word to the Medical Profession," which forcibly illustrates

## "What a Goodly Outside Falsehood Hath."

Half-pound packages as samples to physicians who will indicate their willingness to defray expressage.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# Short Talks on Petroleum

TALK No. 1

**Chemically speaking, "Petroleum is a hydrocarbon."**

Crude petroleum is nauseating and irritating, hence it can be used internally only in a purified form. It should be deprived of both taste and odor; but more important still, it should retain, unimpaired and concentrated, all the virtues of the crude oil, in a form acceptable to both palate and stomach. Such is

*Angier's Petroleum Emulsion*

which contains, in addition to the above, the well-known properties of the hypophosphites of lime and soda.

## What is its Physiological Action?

SHOEMAKER'S MATERIA MEDICA says: "Petroleum possesses decided antiseptic power, is stimulant, and taken internally, in small quantities, is antispasmodic, diaphoretic and expectorant. It disinfects the gastro-intestinal and respiratory mucous tracts."

"THE LONDON LANCET," for March 18, 1893, says, speaking of Angier's Petroleum Emulsion: "From a chemical point of view, the idea of using a pure, bland hydrocarbon as a vehicle for the hypophosphites is decidedly advantageous, for the preservative properties of a hydrocarbon like petroleum are well-known."

## Why Use an Emulsion?

For the reason that the oil is thus artificially prepared for absorption. No risk is run of its being improperly digested. It is all ready to be taken up by the lacteals and to enter the general circulation.

## When is Petroleum Indicated?

In catarrhal, inflammatory and ulcerative diseases of the pulmonary, digestive and urinary organs.

In Consumption and Bronchitis, Angier's Petroleum Emulsion increases flesh and relieves the cough, diarrhœa and night sweats.

Angier's Petroleum Emulsion contains 33⅓ per cent. of purified petroleum and 12 grains to the ounce of the combined salts of lime and soda.

50c. and $1.00 a bottle.

SAMPLES FURNISHED ON APPLICATION.

NEW LEBANON, N. Y.

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

*Medical Letters may be addressed to:*

Sewanee, Tenn.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.
The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.
Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.
EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.
Send for Catalogue, and address

# Liquor Ferri Albuminati. Drees.

**J. P. Grozier Griffith, M.D.,** Professor of Clinical Medicine in the Philadelphia Polyclinic; Assistant Physician to the Hospital of the University of Pennsylvania, says in the course of a lecture on Gastric Affections: "The one which I have employed in this case is the **Liquor Ferri Albuminati,** the solution of albuminate of iron, made by **Drees, of Bentheim, Germany.** It is of neutral reaction, entirely free from metallic taste, does not coagulate albumen, and is usually perfectly well borne by the stomach. Even in cases in which hæmatemesis has recently occured, the use of this preparation is not contra-indicated. The girl of whom I have been speaking, takes it readily. It may be given in doses of 10 drops, three times a day at first, but a much larger amount can later be administered."

*Drees' Liquor Ferri Albuminati* can be obtained of all leading prescription pharmacists in all parts of the United States; all wholesale druggists will supply the article; for further information address the Sole Agents,

**LEHN & FINK, 128 William St., NEW YORK.**

# Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

**SALIPYRIN (RIEDEL).**
**ANALGESIC, ANTI-RHEUMATIC, ANTIPYRETIC.** A chemical combination of 57.7 per cent. antipyrine, and 42.3 per cent. salicylic acid. **Dose, ½ to 2 grammes.** Free from cardiac influence and other unpleasant side and after effects. Used with marked success in Influenza, Neuralgia, and all Rheumatic affections.

**THIOL (RIEDEL).**
A synthetically-produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical report sent on request.

**LYSOL.**
"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

**PIPERAZIN (SCHERING).**
**URIC ACID SOLVENT.** Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

**PHENOCOLL (SCHERING).**
**ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE.** "The superior of all coal-tar antipyretics previously introduced. **Dose, 7½ to 15 grains.** Descriptive pamphlet (40 pages) supplied on request.

**CHLORALAMID (SCHERING).**
**HYPNOTIC.—Dose, 15 to 45 Grains.** A full descriptive pamphlet (64 pages) supplied on request.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

**A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.**

**LEHN & FINK,**
**Importers, Wholesale Druggists and Manufacturing Chemists,**
ADDRESS: P. O. BOX 3114. **NEW YORK.** OFFICE: 128 WILLIAM STREET.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

---

**THE BEST ANTISEPTIC**

**FOR BOTH INTERNAL AND EXTERNAL USE.**

ANTISEPTIC, PROPHYLACTIC, DEODORANT.

# LISTERINE

NON-TOXIC, NON-IRRITANT, NON-ESCHAROTIC.

LISTERINE is a well-proven antiseptic agent—an antizymotic—especially useful in the management of catarrhal conditions of the mucous membrane; adapted to internal use, and to make and maintain surgical cleanliness—asepsis—in the treatment of all parts of the human body, whether by spray, irrigation, atomization, or simple local application, and therefore characterized by its particular adaptability to the field of

**PREVENTIVE MEDICINE—INDIVIDUAL PROPHYLAXIS.**

LISTERINE destroys promptly all odors emanating from diseased gums and teeth, and will be found of great value when taken internally, in teaspoonful doses, to control the fermentative eructations of dyspepsia, and to disinfect the mouth, throat, and stomach. It is a perfect tooth and mouth wash, INDISPENSABLE FOR THE DENTAL TOILET.

# Lambert's Lithiated Hydrangea.

FORMULA.—Each fluid drachm of "Lithiated Hydrangea" represents thirty grains of FRESH HYDRANGEA and three grains of CHEMICALLY PURE Benzo-Salicylate of Lithia. Prepared by our improved process of osmosis, it is INVARIABLY of DEFINITE and UNIFORM therapeutic strength, and hence can be depended upon in clinical practice.

DOSE.—One or two teaspoonfuls four times a day (preferably between meals.)

*Close clinical observation has caused Lambert's Lithiated Hydrangea to be regarded by physicians generally as a very valuable Renal Alterative and Anti-Lithic Agent in the treatment of*

**URINARY CALCULUS, GOUT, RHEUMATISM, CYSTITIS, DIABETES, HÆMATURIA, BRIGHT'S DISEASE, ALBUMINURIA AND VESICAL IRRITATIONS GENERALLY.**

We have much valuable literature upon GENERAL ANTISEPTIC TREATMENT, LITHEMIA, DIABETES, CYSTITIS, ETC., to forward to physicians upon request.

**LAMBERT PHARMACAL COMPANY, St. Louis. Mo.**

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :
This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN**, the most resistant forms of microorganisms were destroyed. **FORMALIN**, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

## SCHERING & GLATZ,

**Sole Representatives in the United States for Chemische Fabrik auf Actien, vorm. E. Schering, BERLIN, Germany.**

55 MAIDEN LANE, NEW YORK.

**PAMPHLETS FURNISHED ON APPLICATION.**

# NEURALGIA.

THE one great characteristic of all varieties of neuralgia is debility of the nervous system, and whatever tends to produce structural or functional enfeeblements of the nerves induces neuralgia, hence all the causes inducing loss of nerve power may be cited as causes of neuralgia. This affection, when not directly the result of some physical cause interfering with the integrity of the nerve system in which the pain is situated, is invariably due to loss of nerve power. Its very existence is evidence of deficient energy. The remote factor may be malaria, syphilis, rheumatism, gout, or any other cause capable of devitalizing the organism, and as a consequence that of the nerves also. Our remedial measures should therefore be directed principally to improving the nutrition of the nervous system generally, and to the removal of any constitutional taint that may be present. The first indication is filled by CELERINA and a generous diet. In facial neuralgia and brow ache it should be administered in connection with quinine, or other tonic remedy, and if malarial influence be suspected, full doses of some reliable anti-malarial remedy should be given. The CELERINA treatment is also applicable to sciatic and spinal neuralgias. Neuralgia in men is frequently an expression of loss of nerve power, and the direct consequence of dissipation and excesses of various kinds, but over-work and intense intellectual exertion will also produce it. Where the pain is located is of little moment, the treatment should be general. In these cases CELERINA seldom fails to give relief. Women suffer more frequently and more intensely from neuralgia than men. They are liable to be affected by all the causes which induces it in men, besides the derangements in health associated with menstruation—menorrhea especially. Hyperfecundation (rapid child-bearing), frequent miscarriage, hemorrhage, prolonged lactation and changes occurring at the climacteric period of life, all tend to induce a neuralgic condition of the nerves. The general treatment should be directed to the removal of the cause whenever this is possible. In these cases CELERINA, combined with ALETRIS CORDIAL will be found to exercise a magical influence.

## RIO CHEMICAL CO.

A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

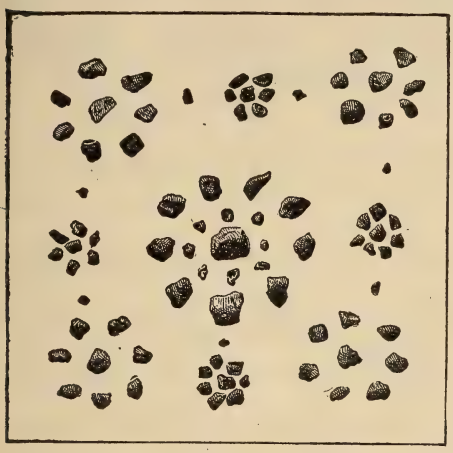

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, Metcalf's Coca Wine acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

## THE BEST ANTISEPTIC

FOR BOTH INTERNAL AND EXTERNAL USE.

ANTISEPTIC, PROPHYLACTIC, DEODORANT.

# LISTERINE

NON-TOXIC, NON-IRRITANT, NON-ESCHAROTIC.

LISTERINE is a well-proven antiseptic agent—an antizymotic—especially useful in the management of catarrhal conditions of the mucous membrane; adapted to internal use, and to make and maintain surgical cleanliness—asepsis—in the treatment of all parts of the human body, whether by spray, irrigation, atomization, or simple local application, and therefore characterized by its particular adaptability to the field of

PREVENTIVE MEDICINE—INDIVIDUAL PROPHYLAXIS.

LISTERINE destroys promptly all odors emanating from diseased gums and teeth, and will be found of great value when taken internally, in teaspoonful doses, to control the fermentative eructations of dyspepsia, and to disinfect the mouth, throat, and stomach. It is a perfect tooth and mouth wash, INDISPENSABLE FOR THE DENTAL TOILET.

# Lambert's Lithiated Hydrangea.

FORMULA.—Each fluid drachm of "Lithiated Hydrangea" represents thirty grains of FRESH HYDRANGEA and three grains of CHEMICALLY PURE Benzo-Salicylate of Lithia. Prepared by our improved process of osmosis, it is INVARIABLY of DEFINITE and UNIFORM therapeutic strength, and hence can be depended upon in clinical practice.

DOSE.—One or two teaspoonfuls four times a day (preferably between meals.)

*Close clinical observation has caused Lambert's Lithiated Hydrangea to be regarded by physicians generally as a very valuable Renal Alterative and Anti-Lithic Agent in the treatment of*

URINARY CALCULUS, GOUT, RHEUMATISM, CYSTITIS, DIABETES, HÆMATURIA, BRIGHT'S DISEASE, ALBUMINURIA AND VESICAL IRRITATIONS GENERALLY.

We have much valuable literature upon GENERAL ANTISEPTIC TREATMENT, LITHEMIA, DIABETES, CYSTITIS, ETC., to forward to physicians upon request.

LAMBERT PHARMACAL COMPANY, St. Louis. Mo.

# FIRWEIN

## THE IDEAL EXPECTORANT

## WHY?

I. Because it contains all the essential ingredients to relieve coughs.
II. Because it is composed of the Balsams associated with Phosphorus, Iodine and Bromine.
III. Because experience has verified the effectiveness of the combination.
IV. Because it can be given in all cases where Cod-Liver Oil is prescribed.

## DISEASES

Wherein it has been prescribed and found unsurpassed.

Acute and Chronic Bronchitis,
Laryngitis, Pneumonia,
Asthma and
Pulmonary Tuberculosis.

**DOSE:** One or Two Teaspoonfuls before meals, or oftener, though regulated by age or disease.

FORMULÆ: Each fluid drachm contains Phosphorus, 1-100 of a grain; Iodine, 1-6 of a grain; Bromine, 1-6 of a grain.
Send for our book of testimonials from eminent physicians who have used this preparation for years.

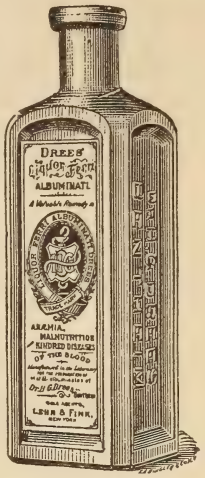
# Liquor Ferri Albuminati. Drees.

**J. P. Grozier Griffith, M.D.,** Professor of Clinical Medicine in the Philadelphia Polyclinic; Assistant Physician to the Hospital of the University of Pennsylvania, says in the course of a lecture on Gastric Affections: "The one which I have employed in this case is the **Liquor Ferri Albuminati,** the solution of albuminate of iron, made by **Drees, of Bentheim, Germany.** It is of neutral reaction, entirely free from metallic taste, does not coagulate albumen, and is usually perfectly well borne by the stomach. Even in cases in which hæmatemesis has recently occured, the use of this preparation is not contra-indicated. The girl of whom I have been speaking, takes it readily. It may be given in doses of 10 drops, three times a day at first, but a much larger amount can later be administered."



*Drees' Liquor Ferri Albuminati* can be obtained of all leading prescription pharmacists in all parts of the United States; all wholesale druggists will supply the article; for further information address the Sole Agents,

**LEHN & FINK, 128 William St., NEW YORK.**

# Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

**SALIPYRIN (RIEDEL).**
**ANALGESIC, ANTI-RHEUMATIC, ANTIPYRETIC.** A chemical combination of 57.7 per cent. antipyrine, and 42.3 per cent. salicylic acid. **Dose, ½ to 2 grammes.** Free from cardiac influence and other unpleasant side and after effects. Used with marked success in Influenza, Neuralgia, and all Rheumatic affections.

**THIOL (RIEDEL).**
A synthetically-produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical report sent on request.

**LYSOL.**
"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

**PIPERAZIN (SCHERING).**
**URIC ACID SOLVENT.** Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

**PHENOCOLL (SCHERING).**
**ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE.** "The superior of all coal-tar antipyretics previously introduced. **Dose, 7½ to 15 grains.** Descriptive pamphlet (40 pages) supplied on request.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1893.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

# PARTURITION.

Aletris Cordial (Rio), given in teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial (Rio). It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial (Rio) in the proportions above stated.

# DÉVIATION DES RÈGLES.

**ALETRIS CORDIAL** (Rio) is, perhaps, the most important remedial agent yet known. It is **THE** remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc., all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use **IS THE DRAGGING SENSATION** in the lower bowels. It quickly restores the strength and waning vitality of chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

*A full size bottle of ALETRIS CORDIAL will be sent FREE to any Physician who wishes to test it if he will pay the express charges.*

**RIO CHEMICAL CO., St. Louis.**

# A WORD
## ON
# MALT EXTRACTS

**The Physician's province is not invaded by the solicitation of lay custom for our malt products.**

**Our Malt Preparations are Medicinal Products to be dispensed by the Pharmacist as the Physician shall prescribe.**

A malt extract, properly speaking, is both a nutritive and a digestive—nutritive because of the presence in it of a large percentage of digested starch; and digestive by virtue of the diastase it contains. It should be remembered that in the administration of pre-digested foods the stomach is entirely relieved of the labor ordinarily incident to digestion, and the assimilation of the full quantity of nourishment introduced into the alimentary canal is thus assured. Malt extracts, as regards their digestive power, are valuable or not, according to the care exercised in their manufacture and the amount of diastase which they contain. This, fortunately, is a matter capable of easy determination by estimating the action of a given quantity of any sample upon starch, under conditions similar to those which prevail during natural digestion.

We have devoted much time and study to the subject of digestives and their manufacture, and in introducing to your attention our Malt Extract we do so with the positive knowledge that it is at once a more active digestive and concentrated nutrient than any similar preparation now on the market.

Aside from the digestive and nutritive value of malt extract, its sweetness and palatability make it a valuable vehicle for the administration of remedies possessed of a disagreeable or nauseating taste.

## THE PROFESSION

Is respectfully requested to write for our literature upon malt extract and its combinations, particularly "A Word to the Medical Profession," which forcibly illustrates

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## CALIFORNIA FIG SYRUP COMPANY

SAN FRANCISCO, CAL.

LOUISVILLE, KY. NEW YORK, N. Y.

# Short Talks on Petroleum

TALK No. 1

**Chemically speaking, "Petroleum is a hydrocarbon."**

Crude petroleum is nauseating and irritating, hence it can be used internally only in a purified form. It should be deprived of both taste and odor; but more important still, it should retain, unimpaired and concentrated, all the virtues of the crude oil, in a form acceptable to both palate and stomach. Such is

*Angier's Petroleum Emulsion*

which contains, in addition to the above, the well-known properties of the hypophosphites of lime and soda.

## What is its Physiological Action?

SHOEMAKER'S MATERIA MEDICA says: "Petroleum possesses decided antiseptic power, is stimulant, and taken internally, in small quantities, is antispasmodic, diaphoretic and expectorant. It disinfects the gastro-intestinal and respiratory mucous tracts."

"THE LONDON LANCET," for March 18, 1893, says, speaking of Angier's Petroleum Emulsion: "From a chemical point of view, the idea of using a pure, bland hydrocarbon as a vehicle for the hypophosphites is decidedly advantageous, for the preservative properties of a hydrocarbon like petroleum are well-known."

## Why Use an Emulsion?

For the reason that the oil is thus artificially prepared for absorption. No risk is run of its being improperly digested. It is all ready to be taken up by the lacteals and to enter the general circulation.

## When is Petroleum Indicated?

In catarrhal, inflammatory and ulcerative diseases of the pulmonary, digestive and urinary organs.

In Consumption and Bronchitis, Angier's Petroleum Emulsion increases flesh and relieves the cough, diarrhœa and night sweats.

Angier's Petroleum Emulsion contains 33⅓ per cent. of purified petroleum and 12 grains to the ounce of the combined salts of lime and soda.

50c. and $1.00 a bottle.

# PHILLIPS' DIGESTIBLE COCOA.

A Peptonized Cocoa in which the fat of the bean is wholly retained and pre-digested by means of Pancreatine. It is a **delicious food beverage** rendered **assimilable,** and is **nourishing to a high degree.**

Besides its adaptability as a **substitute for tea and coffee** in daily use, and as a **convenient and reliable article of diet** in the sick room, it is **particularly recommended in many conditions of debility** where a supply of carbonaceous food is indicated, but where there is difficulty attending the digestion of the ordinary fatty foods.

**Elberfeld, Germany,**

*who, in addition to the remedies herewith described, prepare* SULFONAL-BAYER, SALOPHEN, LOSOPHAN *and* ARISTOL.

# Europhen

AS A COMPLETE SUBSTITUTE for IODOFORM no remedy is comparable to Europhen. It is the best known cicatrisant for open wounds, and catarrhal or ulcerative lesions, whether or not of a specific character; and it has a special value in cavital lesions.

EUROPHEN has five times more covering power than iodoform and adheres to denuded surfaces. It is supplied in ounces, pure, or mixed in equal proportions with Aristol.

# Phenacetine
## (BAYER)

THIS WELL KNOWN REMEDY has justified in the most exceptional manner the opinions of medical men touching its value in modern therapeutics. Phenacetine is indicated in all acute, inflammatory, febrile conditions, and all forms of pain. It is the safest, while the most active, of the antipyretics and analgesics.

PHENACETINE is supplied in *ounces, tablets* and *pills*; also in various combinations with Salophen, Sulfonal, etc.

# Piperazine
## (BAYER)

FOR LITHIASIS, acute and chronic gout, uric acid dyscrasia, and the gouty diathesis generally, no remedy has succeeded so well as PIPERAZINE. In Renal Colic and Urinary Hemorrhage, also, it is especially efficacious. PIPERAZINE-BAYER is made by a new process whereby its cost is greatly reduced.

PIPERAZINE-BAYER is supplied in *half ounces, ounces* and *tablets*. In painful conditions it may be combined with Phenacetine.

# Trional

TRIONAL is a nerve sedative and hypnotic which has given very satisfactory results in cases not amenable to treatment by other drugs. It is peculiarly valuable in cases of slight psychical excitement accompanied by obstinate insomnia. It acts promptly and is useful in many forms of delirium.

TRIONAL is administered in doses of 15 to 30 grains. Where pain is present Trional may be given conjointly with Phenacetine. *Supplied in ounces.*

*Physicians who wish to have the published testimony concerning the therapeutic action of these preparations, or information as to their chemistry or physiological action, should address*

**Sole Agents** — **W. H. Schieffelin & Co.,** NEW YORK. — **For the U. S.**

# NOTE THE FOLLOWING.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well-known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

---

"Merrell's Hydrastis Preparations" are for sale by Wholesale Druggists throughout the United States. Please specify "Wm. S. M. Chem. Co." in ordering or prescribing.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address

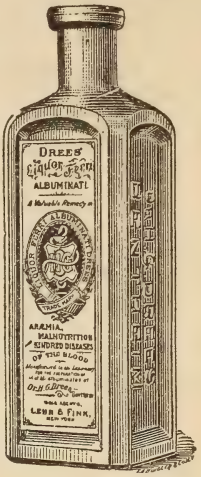
# Liquor Ferri Albuminati. Drees.

**J. P. Grozier Griffith, M.D.,** Professor of Clinical Medicine in the Philadelphia Polyclinic; Assistant Physician to the Hospital of the University of Pennsylvania, says in the course of a lecture on Gastric Affections: "The one which I have employed in this case is the **Liquor Ferri Albuminati**, the solution of albuminate of iron, made by **Drees, of Bentheim, Germany.** It is of neutral reaction, entirely free from metallic taste, does not coagulate albumen, and is usually perfectly well borne by the stomach. Even in cases in which hæmatemesis has recently occured, the use of this preparation is not contra-indicated. The girl of whom I have been speaking, takes it readily. It may be given in doses of 10 drops, three times a day at first, but a much larger amount can later be administered."



*Drees' Liquor Ferri Albuminati* can be obtained of all leading prescription pharmacists in all parts of the United States; all wholesale druggists will supply the article; for further information address the Sole Agents,

**LEHN & FINK, 128 William St., NEW YORK.**

# Definite Chemical Products

OF SUPERIOR THERAPEUTIC VALUE.

**SALIPYRIN (RIEDEL).**
**ANALGESIC, ANTI-RHEUMATIC, ANTIPYRETIC.** A chemical combination of 57.7 per cent. antipyrine, and 42.3 per cent. salicylic acid. **Dose, ½ to 2 grammes.** Free from cardiac influence and other unpleasant side and after effects. Used with marked success in Influenza, Neuralgia, and all Rheumatic affections.

**THIOL (RIEDEL).**
A synthetically-produced body, chemically and therapeutically identical with ICHTHYOL, and superior in being odorless and non-toxic. Supplied in powder and liquid form. Circular reprint of clinical report sent on request.

**LYSOL.**
"THE IDEAL DISINFECTANT." The latest and most perfect of the cresol-derivative antiseptic and disinfectant agents. A 16-page monograph mailed on request.

**PIPERAZIN (SCHERING).**
**URIC ACID SOLVENT.** Will dissolve at least twelve times more uric acid than lithia. **Dose, 15 grains per day,** with continuous treatment. Pamphlet (32 pages) sent on request.

**PHENOCOLL (SCHERING).**
**ANTIPYRETIC, ANTI-RHEUMATIC, ANALGESIC, NERVINE.** "The superior of all coal-tar antipyretics previously introduced. **Dose, 7½ to 15 grains.** Descriptive pamphlet (40 pages) supplied on request.

**CHLORALAMID (SCHERING).**
**HYPNOTIC.—Dose, 15 to 45 Grains.** A full descriptive pamphlet (64 pages) supplied on request.

Physicians are invited to write us whenever desirous of obtaining information regarding any new remedies. We will promptly answer all such inquiries.

**A Sample Copy of "NOTES ON NEW REMEDIES" mailed on request.**

## LEHN & FINK,

**Importers, Wholesale Druggists and Manufacturing Chemists,**

ADDRESS: P. O. BOX 3114. NEW YORK. OFFICE: 128 WILLIAM STREET.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE** from the brain, for diseases of the brain;
**MEDULLINE** from the spinal cord, for diseases of the cord;
**CARDINE** from the heart, for diseases of the heart;
**TESTINE** from the testes, for diseases of the testes;
**OVARINE** from the ovaries, for diseases of the ovaries;
**MUSCULINE** from the muscles, for diseases of the muscles.

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

# An Antipyretic that does not depress the heart

Hence especially useful in

**THE COLUMBIA CHEMICAL CO.**
**90 SOUTH FIFTH AVE., NEW YORK.**

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :

This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN**, the most resistant forms of microorganisms were destroyed. **FORMALIN**, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :

The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

## SCHERING & GLATZ,

**Sole Representatives in the United States for Chemische Fabrik auf Actien, vorm. E. Schering, BERLIN, Germany.**

**55 MAIDEN LANE, NEW YORK.**

**PAMPHLETS FURNISHED ON APPLICATION.**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# HARD-MOUTHED HORSES

## AND PULLERS CONTROLLED WITH ABSOLUTE EASE.

## RUNAWAYS IMPOSSIBLE.

This statement is now repeated by thousands who have purchased

## BRITT'S AUTOMATIC SAFETY BIT.

SAFETY GUARANTEED

Gold Medal, Paris, 1889.

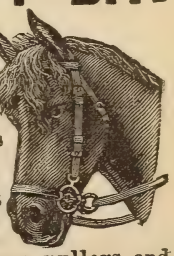
This Bit, by an automatic device, closes the horse's nostrils.

**HE CANNOT BREATHE, AND MUST STOP.**

**SAFETY FROM RUNAWAYS ABSOLUTELY GUARANTEED WITH THIS BIT**

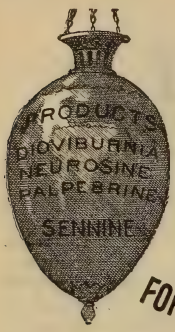
Any horse is liable to run, and should be driven with it. By its use ladies and children drive horses men could not hold with the old style bits.

Send for illustrated pamphlet containing testimonials from all parts of the world, and earnest and candid expressions about the **BRITT AUTOMATIC SAFETY BIT** and its resistless but harmless and humane power in subduing the most vicious horses and controlling the most **stubborn pullers** and chronic runaways.



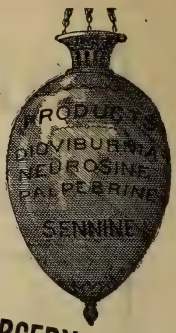
The only bit in the world that is endorsed, advocated, used and sold by the Society for the **Prevention of Cruelty to Animals,** *The Highest Authority.*

**DR. L. P. BRITT, 37 COLLEGE PLACE, NEW YORK.**



# SENNINE

## THE NEW AMERICAN ANTISEPTIC



FOR INTERNAL AND EXTERNAL USE IN MEDICINE AND SURGERY

**COMPOSITION**—A Chemically Pure Product of Boracic Acid and Phenol.

**PHYSICAL PROPERTIES**—A very fine White Powder, Odorless, Slightly Astringent, and of Sweetish Taste.

**MEDICAL PROPERTIES**—Antiseptic, Antizimotic, Bactericide, Deodorant, Disinfectant.

**Comparatively Inexpensive**—Five parts of SENNINE dissolved in 100 parts of water (2⅝ make 4 pints), is sufficiently strong for an antiseptic wash.

**Free from Toxic and Irritating Effects,** a substitute for Carbolic Acid, Bichloride of Mercury, Iodoform, etc.

Put up in 2 oz. Tin Boxes with inner Perforated Cover for convenience of applying. **Price, $1.00.**
Samples and literature mailed FREE to Physicians on application.

Dios Chemical Company, - St. Louis, Mo., U.S.A.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, Metcalf's Coca Wine acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

## THE BEST ANTISEPTIC

## FOR BOTH INTERNAL AND EXTERNAL USE.

ANTISEPTIC, PROPHYLACTIC, DEODORANT.

# LISTERINE

NON-TOXIC, NON-IRRITANT, NON-ESCHAROTIC.

LISTERINE is a well-proven antiseptic agent—an antizymotic—especially useful in the management of catarrhal conditions of the mucous membrane; adapted to internal use, and to make and maintain surgical cleanliness—asepsis—in the treatment of all parts of the human body, whether by spray, irrigation, atomization, or simple local application, and therefore characterized by its particular adaptability to the field of

**PREVENTIVE MEDICINE—INDIVIDUAL PROPHYLAXIS.**

LISTERINE destroys promptly all odors emanating from diseased gums and teeth, and will be found of great value when taken internally, in teaspoonful doses, to control the fermentative eructations of dyspepsia, and to disinfect the mouth, throat, and stomach. It is a perfect tooth and mouth wash, INDISPENSABLE FOR THE DENTAL TOILET.

# Lambert's Lithiated Hydrangea.

FORMULA.—Each fluid drachm of "Lithiated Hydrangea" represents thirty grains of FRESH HYDRANGEA and three grains of CHEMICALLY PURE Benzo-Salicylate of Lithia. Prepared by our improved process of osmosis, it is INVARIABLY of DEFINITE and UNIFORM therapeutic strength, and hence can be depended upon in clinical practice.

DOSE.—One or two teaspoonfuls four times a day (preferably between meals.)

*Close clinical observation has caused Lambert's Lithiated Hydrangea to be regarded by physicians generally as a very valuable Renal Alterative and Anti-Lithic Agent in the treatment of*

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address

**Philadelphia, Pa., U. S. A.**

# Dr. Unna's Plaster-Mulls

**Are prepared according to directions of the originator, Dr. P. G. UNNA, the eminent dermatologist, by P. BEIERSDORF & CO., Hamburg, Germany.**

PLASTER-MULLS are an ideal improvement on the ordinary spread plasters. The medicament is dissolved in a minimum quantity of a suitable vehicle, and is evenly spread on the thinnest possible layer of gutta-percha, backed by fine gauze (or mull). The gutta-percha layer hermetically seals the covered skin-surface and prevents transpiration (or exhalation) of the pores; thereby the medicament is more deeply absorbed, and the therapeutic effect is more intense and powerful. The stratum of plaster is very thin, consisting of a non-irritant vehicle and the medicament; the former in smallest possible proportion, and the latter in exact dosage perfectly dissolved, so that every particle will act its full remedial part. So perfect is this distribution of the medicament that every square piece, subdivision of a metre, will contain its exact proportion of the total quantity of medicament in a metre roll. Exact dosage and effect is thus guaranteed. The gutta-percha being elastic and pliable, the Plaster-Mulls allow of closest affinity to the skin, and any part of the body can be perfectly covered without necessity for cutting the plaster. Thus, in every particular these Plaster-Mulls are vastly superior to the old-style thickly-spread plasters and ointments.

These Plaster-Mulls have been used and favorably endorsed by many authorities, such as:

| | |
|---|---|
| NEGA, | MORRISON, |
| WILL, | J. C. MCGUIRE, |
| JANOWSKY, | SCHWIMMER, |
| MCCALL ANDERSON, | CHOTZEN, |
| FRANK, | BULKLEY, |

BORCK, and many others.

We are now prepared to supply Plaster-Mulls in 1 metre canisters; circulars giving list of medicaments, indications, etc., mailed free on receipt.

**Sole Agents for America:**

| 27 | Oxide Zinc ... and Tar ..... | 10 (or $\frac{1}{30}$ gr. " " ) 5 (or $\frac{1}{60}$ gr. " " ) | Eczema chronic, etc. | |
| 66 | Ichthyol ..... | 10 (or $\frac{1}{30}$ gr. " " ) | Rheumatism, etc. | |
| 72 | Resorcin ..... | 15 (or $\frac{1}{20}$ gr. " " ) | Acne, Furunculosis, Rosacea, Eczema chron. | |
| 76 | Salicylic Acid . and Creasote . | 10 (or $\frac{1}{30}$ gr. " " ) 20 (or $\frac{1}{15}$ gr. " " ) | Lupus, etc. | |
| 78 | Salicylic Acid . and Creasote . | 20 (or $\frac{1}{15}$ gr. " " ) 40 (or $\frac{2}{15}$ gr. " " ) | Lupus, etc. | |

The above quoted assortment we now carry regularly in stock; other medicaments and combinations will be added as the demand increases. We are prepared to furnish other or special medicaments on short notice—two weeks if ordered by cable, three weeks by mail. Physicians are invited to investigate the merits of these Plaster-Mulls; a trial is sure to merit continued preference.

**LEHN & FINK, Sole Agents, 128 William Street, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

# 12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

# Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation."**

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

# Dysmenorrhea.

• • •

DYSMENORRHEA.—The experience of the profession demonstrates that ALETRIS CORDIAL (Rio) given in teaspoonful doses, three times a day, not only relieves dysmenorrhea, but taken continuously, usually effects a permanent cure. It is also of the utmost value in prolapsus uteri and all derangements of the uterus. Being strictly a uterine tonic, it has a direct affinity for the reproductive organs, and exercises a healthy tonicity over their functional activity. It is the female tonic par excellence.

I used ALETRIS CORDIAL with very good results, in the case of Mrs. ———, aged 23. Since the birth of her child five years ago, she has been in a very poor state of health. At the time I saw her she was very much reduced. She also, since the birth of her child, had suffered with dysmenorrhea of a most severe type, the pain usually beginning three or four days before the appearance of the menstrual flow, and lasting until one or two days after, its appearance being so severe as to confine her to her bed. She was also very nervous, had not much appetite, and did not sleep well. I ordered one teaspoonful of ALETRIS CORDIAL, three times daily, beginning one week before the appearance of the menstrual flow, and continued for two weeks, then to discontinue its use until a week before the next period. In conjunction, she also took one teaspoonful of CELERINA one hour after each meal, as I thought it would be beneficial, on account of her nervous condition. I began to notice improvement in a short time, and at the next menstrual period there was but little pain. From that time on there was marked improvement, until at the end of two months she was free from pain at the catamenial periods. The nervous phenomena improved, as did also her appetite, until she is now, according to statement made to me yesterday, in better health than she has been for six years.

J. A. McMURRAY, M.D., Marion, Ohio.

I have found ALETRIS CORDIAL to be invaluable in cases of amenorrhea and in dysmenorrhea, and I prescribe it very often. JOHN CALDWELL, M.D.,
Shott's Iron Works, Lanarkshire, Scotland.

After having made due trial, I found that ALETRIS CORDIAL is a powerful regulator of uterine circulation. It is as efficacious in cases of dysmenorrhea as in those of metrorrhagia. DR. J. ZABE, Paris, France.

I have found ALETRIS CORDIAL to give great relief in dysmenorrhea. In fact it has succeeded where most of the well-known remedies have failed.

H. LLOYD WHITESTONE, L.R.C.S.I., &c.,
The Terrace, West Bromwich, London, England.

After having given ALETRIS CORDIAL a trial, I am glad to say I can speak highly of it, on account of the results I obtained from its use in a case of dysmenorrhea. I shall certainly continue to prescribe it. T. D. WHITE, M.D.,
40 Elgin Ave., Paddington, London, W., England.

* * * * * * * * * * * * * * * * * * * * * * * * * * *

A full size bottle of ALETRIS CORDIAL will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

# Phytoline

## A POWERFUL ANTI-FAT.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF PHYTOLACCA DECANDRA.

PHYTOLINE is the only Remdy that will absorb fatty tissue in a great degree without any evil after effects whatsoever. By its powerful though harmless action it replaces morbid tissue with solid flesh.

THIS STYLE ONLY.

FOR OBESITY AND FATTY DEGENERATION OF THE HEART, PRESCRIBE:

℞ Phytoline (Walker) ℥ II
Sig. Take ten drops before and after the three daily meals.

ENDORSED BY THE MEDICAL PROFESSION THROUGHOUT THE UNITED STATES.

DISPENSED BY DRUGGISTS.

For Literature and Clinical Reports, address:

WALKER PHARMACAL COMPANY. ST. LOUIS, MO. U.S.A.

WE CANNOT AFFORD TO DISTRIBUTE SAMPLES OF THE REMEDY PHYTOLINE, AS THE COST TO US IS GREAT, BUT WE WILL MAIL ANY PHYSICIAN ONE FULL SIZE BOTTLE UPON RECEIPT OF THE WHOLESALE PRICE OF $1.00 AND 10 CTS. FOR POSTAGE. WE WOULD SUGGEST HOWEVER THAT YOUR DRUGGIST ORDER A SUPPLY FOR YOUR PRESCRIPTIONS. A. Lambrecht, del.

# Treatment of Cholera.

**Dr. Chas. Gatchell,** of Chicago, in his "*Treatment of Cholera,*" says: "As it is known that the cholera microbe does not flourish in acid solutions, it would be well to slightly acidulate the drinking water. This may be done by adding to each glass of water half a teaspoonful of **Horsford's Acid Phosphate.** This will not only render the water of an acid reaction, but also render boiled water more agreeable to the taste. It may be sweetened if desired. The **Acid Phosphate,** taken as recommended, will also tend to invigorate the system and correct debility, thus giving increased power of resistance to disease. It is the acid of the system, a product of the gastric functions, and hence, will not create that disturbance liable to follow the use of mineral acids."

**Send for descriptive circular. Physicians who wish to test it will be furnshed, upon application, with a sample, by mail, or a full sized bottle without expense, except express charges. Prepared under the direction of Prof. E. N. Horsford, by the**

# A WORD
## ON
# MALT EXTRACTS

**The Physician's province is not invaded by the solicitation of lay custom for our malt products.**

**Our Malt Preparations are Medicinal Products to be dispensed by the Pharmacist as the Physician shall prescribe.**

A malt extract, properly speaking, is both a nutritive and a digestive—nutritive because of the presence in it of a large percentage of digested starch; and digestive by virtue of the diastase it contains. It should be remembered that in the administration of pre-digested foods the stomach is entirely relieved of the labor ordinarily incident to digestion, and the assimilation of the full quantity of nourishment introduced into the alimentary canal is thus assured. Malt extracts, as regards their digestive power, are valuable or not, according to the care exercised in their manufacture and the amount of diastase which they contain. This, fortunately, is a matter capable of easy determination by estimating the action of a given quantity of any sample upon starch, under conditions similar to those which prevail during natural digestion.

We have devoted much time and study to the subject of digestives and their manufacture, and in introducing to your attention our Malt Extract we do so with the positive knowledge that it is at once a more active digestive and concentrated nutrient than any similar preparation now on the market.

Aside from the digestive and nutritive value of malt extract, its sweetness and palatability make it a valuable vehicle for the administration of remedies possessed of a disagreeable or nauseating taste.

## THE PROFESSION

Is respectfully requested to write for our literature upon malt extract and its combinations, particularly "A Word to the Medical Profession," which forcibly illustrates

## "What a Goodly Outside Falsehood Hath."

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# Short Talks on Petroleum

TALK No. 1

**Chemically speaking, "Petroleum is a hydrocarbon."**

Crude petroleum is nauseating and irritating, hence it can be used internally only in a purified form. It should be deprived of both taste and odor; but more important still, it should retain, unimpaired and concentrated, all the virtues of the crude oil, in a form acceptable to both palate and stomach. Such is

*Angier's Petroleum Emulsion*

which contains, in addition to the above, the well-known properties of the hypophosphites of lime and soda.

## What is its Physiological Action?

SHOEMAKER'S MATERIA MEDICA says: "Petroleum possesses decided antiseptic power, is stimulant, and taken internally, in small quantities, is antispasmodic, diaphoretic and expectorant. It disinfects the gastro-intestinal and respiratory mucous tracts."

"THE LONDON LANCET," for March 18, 1893, says, speaking of Angier's Petroleum Emulsion: "From a chemical point of view, the idea of using a pure, bland hydrocarbon as a vehicle for the hypophosphites is decidedly advantageous, for the preservative properties of a hydrocarbon like petroleum are well-known."

## Why Use an Emulsion?

For the reason that the oil is thus artificially prepared for absorption. No risk is run of its being improperly digested. It is all ready to be taken up by the lacteals and to enter the general circulation.

## When is Petroleum Indicated?

In catarrhal, inflammatory and ulcerative diseases of the pulmonary, digestive and urinary organs.

In Consumption and Bronchitis, Angier's Petroleum Emulsion increases flesh and relieves the cough, diarrhœa and night sweats.

Angier's Petroleum Emulsion contains 33⅓ per cent. of purified petroleum and 12 grains to the ounce of the combined salts of lime and soda.

50c. and $1.00 a bottle.

Send for samples and literature to

*who, in addition to the remedies herewith described, prepare* SULFONAL-BAYER, SALOPHEN, LOSOPHAN *and* ARISTOL.

# Europhen

AS A COMPLETE SUBSTITUTE for IODOFORM no remedy is comparable to Europhen. It is the best known cicatrisant for open wounds, and catarrhal or ulcerative lesions, whether or not of a specific character; and it has a special value in cavital lesions.

EUROPHEN has five times more covering power than iodoform and adheres to denuded surfaces. It is supplied in ounces, pure, or mixed in equal proportions with Aristol.

# Phenacetine
## (BAYER)

THIS WELL KNOWN REMEDY has justified in the most exceptional manner the opinions of medical men touching its value in modern therapeutics. Phenacetine is indicated in all acute, inflammatory, febrile conditions, and all forms of pain. It is the safest, while the most active, of the antipyretics and analgesics.

PHENACETINE is supplied in *ounces, tablets* and *pills*; also in various combinations with Salophen. Sulfonal, etc.

# Piperazine
## (BAYER)

FOR LITHIASIS, acute and chronic gout, uric acid dyscrasia, and the gouty diathesis generally, no remedy has succeeded so well as PIPERAZINE. In Renal Colic and Urinary Hemorrhage, also, it is especially efficacious. PIPERAZINE-BAYER is made by a new process whereby its cost is greatly reduced.

PIPERAZINE-BAYER is supplied in *half ounces, ounces* and *tablets*. In painful conditions it may be combined with Phenacetine.

# Trional

TRIONAL is a nerve sedative and hypnotic which has given very satisfactory results in cases not amenable to treatment by other drugs. It is peculiarly valuable in cases of slight psychical excitement accompanied by obstinate insomnia. It acts promptly and is useful in many forms of delirium.

TRIONAL is administered in doses of 15 to 30 grains. Where pain is present Trional may be given conjointly with Phenacetine. *Supplied in ounces.*

*Physicians who wish to have the published testimony concerning the therapeutic action of these preparations, or information as to their chemistry or physiological action, should address*

**Sole Agents** **W. H. Schieffelin & Co.,** **For the U. S.**

**NEW YORK.**

# NOTE THE FOLLOWING.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M.D., *Memver of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

Lysol
TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on LYSOL, sent to physicians free on request.

LEHN & FINK, Sole Agents, NEW YORK.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.**
This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1⅓ per mille solution of **FORMALIN**, the most resistant forms of microorganisms were destroyed. **FORMALIN**, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.**
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

**PAMPHLETS FURNISHED ON APPLICATION.**

# S. H. KENNEDY'S EXTRACT OF PINUS CANADENSIS.

I have used S. H. KENNEDY'S EXTRACT PINUS CANADENSIS in some affections of the rectum, vagina and cervix uteri. I have used it considerably diluted as a vaginal wash, with great success; but I prefer to apply it to the os tincæ on cotton wool, either pure or mixed with glycerine and rose water. Thus applied, it should remain intact for two or three, or even four days, and then be renewed. In this way I have seen chronic granular erosions, with leucorrhea, disappear very rapidly under its use. I have not time to do more than call the attention of my professional brethren to this new extract, which I am sure will soon be recognized as a valuable addition to our Materia Medica.

J. Marion Sims.

NEW YORK.

*A sample bottle of S. H. KENNEDY'S EXTRACT PINUS CANADENSIS will be sent FREE to any Physician who wishes to test it if he will pay the express charges.*

# A WORD
## ON
# MALT EXTRACTS

**The Physician's province is not invaded by the solicitation of lay custom for our malt products.**

**Our Malt Preparations are Medicinal Products to be dispensed by the Pharmacist as the Physician shall prescribe.**

A malt extract, properly speaking, is both a nutritive and a digestive—nutritive because of the presence in it of a large percentage of digested starch; and digestive by virtue of the diastase it contains. It should be remembered that in the administration of pre-digested foods the stomach is entirely relieved of the labor ordinarily incident to digestion, and the assimilation of the full quantity of nourishment introduced into the alimentary canal is thus assured. Malt extracts, as regards their digestive power, are valuable or not, according to the care exercised in their manufacture and the amount of diastase which they contain. This, fortunately, is a matter capable of easy determination by estimating the action of a given quantity of any sample upon starch, under conditions similar to those which prevail during natural digestion.

We have devoted much time and study to the subject of digestives and their manufacture, and in introducing to your attention our Malt Extract we do so with the positive knowledge that it is at once a more active digestive and concentrated nutrient than any similar preparation now on the market.

Aside from the digestive and nutritive value of malt extract, its sweetness and palatability make it a valuable vehicle for the administration of remedies possessed of a disagreeable or nauseating taste.

## THE PROFESSION

Is respectfully requested to write for our literature upon Malt Extract and its combinations, particularly "A Word to the Medical Profession," which forcibly illustrates

## "What a Goodly Outside Falsehood Hath."

☞ Half-pound packages as samples to physicians who will indicate their willingness to defray expressage.

# SPECIAL NOTICE!

## A NEW MATERIA MEDICA.

For nearly two years the ORGANIC MATERIA MEDICA first issued by us in 1888, and a revised edition of which was printed in 1890, has been out of print, and we have not been able to supply copies.

We have, however, just issued another work which covers all the information contained in the original edition but revised up to date, and with much new and interesting matter added.

The first 184 pages contain notes, in alphabetic order, of those articles of the Materia Medica of which we manufacture any preparation, giving therapeutic properties, doses, etc. Then follow formulæ for making official preparations; much valuable information in the way of tables of weights and measures; weights and measures equivalents; tables of thermometric equivalents; axioms in posology; thermometry; treatment of children; incompatibility; Latin words and phrases; differential diagnosis of eruptive fevers; therapeutic suggestions, or diseases and their remedies; poisons and their antidotes; finally, a general index which will facilitate reference to any article under whatever title the reader may expect to find it.

We shall be pleased to send a copy, bound in stiff paper cover, to any physician or druggist on receipt of the actual cost of mailing, 10 cents, which may be remitted in postage stamps.

To any physician or druggist desiring the book bound in a more substantial cover and convenient manner, we will send a copy bound in cloth upon receipt of 25 cents in postage. *Applications should be addressed: Parke, Davis & Co., Box 468, Detroit, Mich.*

# *Bedford Springs Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

CALIFORNIA FIG SYRUP COMPANY

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address
DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

## WALNUT LODGE HOSPITAL

**HARTFORD, CONNECTICUT.**

Organized in 1880 for the special medical treatment of
**ALCOHOL AND OPIUM INEBRIATES.**

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
**Sup't Walnut Lodge, Hartford, Conn.**

## University of Maryland,

**FACULTY OF PHYSIC,**

**BALTIMORE, MD.**

The Eighty-Seventh Annual Session commences October 2d, 1893, and ends in April, 1894. Large amount of clinical material, and ample facilities for work in chemical and histological laboratories and in the dissecting room. Each graduate has personal experience in obstetrics.

For Catalogue and other information, address

**Dr. J. EDWIN MICHAEL,**
**201 W. Franklin St., Baltimore.**

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

Lysol
TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on Lysol, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

☞ Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :
This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL's observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1⅓ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

**PAMPHLETS FURNISHED ON APPLICATION.**

# CELERINA.

**W. P. England, M. D., White Pine, Pa.,** says: I have used Celerina and am pleased to say that in all cases of nervous prostration, such as follows the use of alcohol, and for all cases of nervous debility, I find it without an equal. After the experience I have had with it I do not hesitate in recommending it to the profession as one of our best nerve tonics.

**The action of Celerina on the brain and nervous system is that of an exhilarant and slight narcotic, relieving depressions and lessens irritable nerve conditions. In cases of organic and functional lesions of the heart, an increased steadiness of pulse-beat and diminution of pulse irritation is apparent.**

**A. J. Wesco, M. D., Seven Mile, O.,** says: I have tested Celerina and got good results. Man, aged sixty-five years, mechanic, habits very intemperate, will spree for weeks, came to me with nervous system in bad fix; could not eat or sleep. Gave him eight ounces Celerina, teaspoonful three times a day, which placed him on his feet again, and for that I think it par excellence.

**Convulsions may frequently be cut short, like magic, by teaspoonful doses of Celerina repeated at short intervals. The nausea as an after-effect of chloroform or other narcosis, may generally be controlled in the same manner.**

**T. J. Haile, M. D., Atlanta, Ga.,** says: Celerina has always acted finely in all cases where I have tried it, especially in those troublesome cases of hysteria, nervous depression and feebleness, and prostration resulting from alcoholic excess. Have found its effects very exhilarating and nourishing. In fact, it is my main dependence in all nervous diseases.

**The psychological depressions and neuralgias, so common in the period following a debauch, are lessened or disappear altogether by the use of Celerina.**

**J. B. Johnson, M. D., 920 N St., Washington, D. C.,** says: I used Celerina not only as a nervine and tonic, but also found it most excellent, in two drachm doses, in sobering persons who were made drunk by alcoholic drink, and such patients informed me that they were greatly assisted in recovering from a spree by the use of Celerina.

**After the removal of alcohol, Celerina, given in doses of from one-half to one ounce every four hours, is speedily followed by the most characteristic symptoms of improvement.**

**Dr. Bramwell, Whitley, Northumberland, England,** says: I have found Celerina valuable as a nerve stimulant and restorative in a patient suffering from the effects of a severe drinking bout.

## RIO CHEMICAL CO.,

A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

**ST. LOUIS, MO.**

# Phytoline

## A POWERFUL ANTI-FAT.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF PHYTOLACCA DECANDRA.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

## AND PULLERS CONTROLLED WITH ABSOLUTE EASE.
## RUNAWAYS IMPOSSIBLE.

This statement is now repeated by thousands who have purchased

## BRITT'S AUTOMATIC SAFETY BIT.

SAFETY GUARANTEED

Gold Medal, Paris, 1889.

This Bit, by an automatic device, closes the horse's nostrils.

**HE CANNOT BREATHE, AND MUST STOP.**

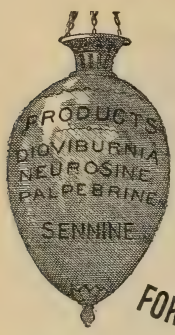
**SAFETY FROM RUNAWAYS ABSOLUTELY GUARANTEED WITH THIS BIT**

Any horse is liable to run, and should be driven with it. By its use ladies and children drive horses men could not hold with the old style bits.

Send for illustrated pamphlet containing testimonials from all parts of the world, and earnest and candid expressions about the **BRITT AUTOMATIC SAFETY BIT** and its resistless but harmless and humane power in subduing the most vicious horses and controlling the most **stubborn pullers** and chronic runaways.

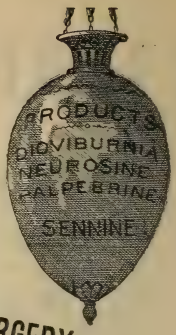
The only bit in the world that is endorsed, advocated, used and sold by the Society for the **Prevention of Cruelty to Animals,** *The Highest Authority.*

**DR. L. P. BRITT, 37 COLLEGE PLACE, NEW YORK.**



# SENNINE

## THE NEW AMERICAN ANTISEPTIC



FOR INTERNAL AND EXTERNAL USE IN MEDICINE AND SURGERY

**COMPOSITION**—A Chemically Pure Product of Boracic Acid and Phenol.

**PHYSICAL PROPERTIES**—A very fine White Powder, Odorless, Slightly Astringent, and of Sweetish Taste.

**MEDICAL PROPERTIES**—Antiseptic, Antizimotic, Bactericide, Deodorant, Disinfectant.

**Comparatively Inexpensive**—Five parts of SENNINE dissolved in 100 parts of water (2⅝ make 4 pints), is sufficiently strong for an antiseptic wash.

**Free from Toxic and Irritating Effects,** Therefore preferable to Carbolic Acid, Bichloride of Mercury, Iodoform, etc.

Put up in 2 oz. Tin Boxes with inner Perforated Cover for convenience of applying. **Price, $1.00.**
Samples and literature mailed FREE to Physicians on application.

Dios Chemical Company, - St. Louis, Mo., U. S. A.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles**, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

HALL & RUCKEL,

218 Greenwich St. New York City.

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails.

A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc.

THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

MAIL US YOUR Name and Address and we will send book of TESTIMONIALS.

THE BEST ANTISEPTIC

FOR BOTH INTERNAL AND EXTERNAL USE.

ANTISEPTIC, PROPHYLACTIC, DEODORANT.

# LISTERINE

NON-TOXIC, NON-IRRITANT, NON-ESCHAROTIC.

LISTERINE is a well-proven antiseptic agent—an antizymotic—especially useful in the management of catarrhal conditions of the mucous membrane; adapted to internal use, and to make and maintain surgical cleanliness—asepsis—in the treatment of all parts of the human body, whether by spray, irrigation, atomization, or simple local application, and therefore characterized by its particular adaptability to the field of

PREVENTIVE MEDICINE—INDIVIDUAL PROPHYLAXIS.

LISTERINE destroys promptly all odors emanating from diseased gums and teeth, and will be found of great value when taken internally, in teaspoonful doses, to control the fermentative eructations of dyspepsia, and to disinfect the mouth, throat, and stomach. It is a perfect tooth and mouth wash, INDISPENSABLE FOR THE DENTAL TOILET.

# Lambert's Lithiated Hydrangea.

FORMULA.—Each fluid drachm of "Lithiated Hydrangea" represents thirty grains of FRESH HYDRANGEA and three grains of CHEMICALLY PURE Benzo-Salicylate of Lithia. Prepared by our improved process of osmosis, it is INVARIABLY of DEFINITE and UNIFORM therapeutic strength, and hence can be depended upon in clinical practice.

DOSE.—One or two teaspoonfuls four times a day (preferably between meals.)

*Close clinical observation has caused Lambert's Lithiated Hydrangea to be regarded by physicians generally as a very valuable Renal Alterative and Anti-Lithic Agent in the treatment of*

**URINARY CALCULUS, GOUT, RHEUMATISM, CYSTITIS, DIABETES, HÆMATURIA, BRIGHT'S DISEASE, ALBUMINURIA AND VESICAL IRRITATIONS GENERALLY.**

# Dr. Unna's Plaster-Mulls

**Are prepared according to directions of the originator, Dr. P. G. UNNA, the eminent dermatologist, by P. BEIERSDORF & CO., Hamburg, Germany.**

PLASTER-MULLS are an ideal improvement on the ordinary spread plasters. The medicament is dissolved in a minimum quantity of a suitable vehicle, and is evenly spread on the thinnest possible layer of gutta-percha, backed by fine gauze (or mull). The gutta-percha layer hermetically seals the covered skin-surface and prevents transpiration (or exhalation) of the pores; thereby the medicament is more deeply absorbed, and the therapeutic effect is more intense and powerful. The stratum of plaster is very thin, consisting of a non-irritant vehicle and the medicament; the former in smallest possible proportion, and the latter in exact dosage perfectly dissolved, so that every particle will act its full remedial part. So perfect is this distribution of the medicament that every square piece, subdivision of a metre, will contain its exact proportion of the total quantity of medicament in a metre roll. Exact dosage and effect is thus guaranteed. The gutta-percha being elastic and pliable, the Plaster-Mulls allow of closest affinity to the skin, and any part of the body can be perfectly covered without necessity for cutting the plaster. Thus, in every particular these Plaster-Mulls are vastly superior to the old-style thickly-spread plasters and ointments.

These Plaster-Mulls have been used and favorably endorsed by many authorities, such as:

NEGA, MORRISON,
WILL, J. C. MCGUIRE,
JANOWSKY, SCHWIMMER,
MCCALL ANDERSON, CHOTZEN,
FRANK, BULKLEY,
BORCK, and many others.

We are now prepared to supply Plaster-Mulls in 1 metre canisters; circulars giving list of medicaments, indications, etc., mailed free on receipt.

**Sole Agents for America:**

**LEHN & FINK, NEW YORK**

## Descriptive Price-List of Dr. Unna's Plaster-Mulls.

| 78 | Salicylic Acid . and Creasote . | 20 (or $\frac{1}{15}$ gr. " " ) 40 (or $\frac{2}{15}$ gr. " " ) | Lupus, etc. | |

The above quoted assortment we now carry regularly in stock; other medicaments and combinations will be added as the demand increases. We are prepared to furnish other or special medicaments on short notice—two weeks if ordered by cable, three weeks by mail. Physicians are invited to investigate the merits of these Plaster-Mulls; a trial is sure to merit continued preference.

**LEHN & FINK, Sole Agents, 128 William Street, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

CEREBRINE from the brain, for diseases of the brain;
MEDULLINE from the spinal cord, for diseases of the cord;
CARDINE from the heart, for diseases of the heart;
TESTINE from the testes, for diseases of the testes;
OVARINE from the ovaries, for diseases of the ovaries;
MUSCULINE from the muscles, for diseases of the muscles.

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

*THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.*

# 12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

# Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation.**"

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

| Algernon Charles Swinburne, | William Huggins, | Miss Octavia Hill, |
| J. Norman Lockyer, F. R. S., | Andrew Lang, | V. Paget. |

### RECENT OPINIONS:

"There is a great deal of thoughtful and instructive matter in the British Magazines and reviews of which the reader should not be ignorant. In order to get access to this matter, the cheapest and most convenient way is to subscribe to LITTELL'S LIVING AGE, Boston's weekly eclectic, in which will always be found the cream of the foreign periodicals."—*The Times-Union*, Albany, N. Y.

"Only the best has ever filled its pages; the best thought, rendered in the purest English. Nothing poor or unworthy has ever appeared in the columns of THE LIVING AGE."—*The Presbyterian*, Philadelphia.

"We have almost exhausted our terms of praise in speaking of this weekly magazine, but we commend it as heartily as ever as a grand repository of the literature of the age."—*N. Y. Observer.*

"One may find here all that is worth his while to know of foreign literature in all its departments."—*Advance*, Chicago.

"Full of vitality and interest."—*Journal*, Boston.

**Published Weekly at $8.00 a year, free of postage. Sample copies, 15c. each.**

**CLUB PRICES FOR THE BEST HOME AND FOREIGN LITERATURE.**

["Possessed of LITTELL'S LIVING AGE, and of one or other of our vivacious American monthlies, a subscriber will find himself *in command of the whole situation.*"—*Philadelphia Evening Bulletin.*]

For $11.25, THE LIVING AGE and *The Arena*, or *The Forum*, or *Gaillard's Medical Journal* or the *Magazine of American History* will be sent, postpaid, for one year.

For $10.50, THE LIVING AGE and any one of the *four-dollar* monthly magazines (or *Harper's Weekly* or *Bazaar*) will be sent for a year, postpaid; or, for $9.50, THE LIVING AGE and *Scribner's Magazine*, or the *St. Nicholas*; or for $9.25, THE LIVING AGE and *Lippincott's Magazine*, or *Poet Lore*, or *Review of Reviews.*

Rates for clubbing THE LIVING AGE with more than one other periodical will be sent on application.

# Uterine Diseases.

I am much pleased with ALETRIS CORDIAL as a remedy in uterine diseases. I have been in constant practice for more than half a century, and have used the aletris farinosa most of the time. When I learned the composition of the ALETRIS CORDIAL (Rio Chem. Co.) I inferred at once that it would prove a very good uterine tonic, and find it is just the thing. Following is a case in which I used ALETRIS CORDIAL: Mrs. C., aged 33 years, has been suffering since confinement, some two years since, with leucorrhea, more or less most of the time and frequently quite profuse. I have treated her with ordinary remedies, such as tonics internally and astringent injections, with variable results, but never entirely relieving the leucorrhea. Her general health suffered less than common in such persistent cases. Some time since I made a more critical examination, and found preternatural redness of whole vaginal cavity from labia to uterus; the cervix uteri and the os tumified and sensitive to touch, as also the abdomen, especially over the ovaries; cold feet, hot head, debility and nervous exhaustion, odorous urine, itching of the vulva, etc. I used S. H. KENNEDY'S EXTRACT OF PINUS CANADENSIS as an injection and put the patient on ALETRIS CORDIAL. By the time the first bottle was used, the disease was about cured. The leucorrheal discharge ceased and the redness, etc., much diminished. I attribute her speedy relief to the ALETRIS CORDIAL, for all other applications had been persistently tested with but little benefit. I expected the ALETRIS CORDIAL to tone up the weakened womb, but supposed something more specific would be requisite to subdue the irritation and subacute inflammation of the vagina. JOS. S. BURR, M.D., Leesville, O.

---

I had under my treatment a lady, Mrs. H., 36 years of age, married twelve years, no children, who had suffered for twenty years with painful and irregular menstruation, followed by leucorrhea and nervous hysteria at times. She had tried all kinds of drugs, but not receiving any benefit from them, consulted a number of physicians, but also without effect. The 14th of April last she became one of my patients, and I prescribed the usual formulas which were carefully prepared at my own dispensary, but to her and my regret only gained momentary benefit. I concluded to make a trial of the following prescription:

R. Celerina ..... 8 ounces.
ALETRIS CORDIAL ..... 8 ounces.
M. Sig.: Two teaspoonfuls half an hour before meals.

For injection I prescribed one part S. H. KENNEDY'S EXTRACT OF PINUS CANADENSIS (White) with nine parts of water, three times a day. The result has been surprising. I wanted the lady to continue the medicines, but Mrs. H. insisted upon not doing it, for she claimed that having regained her youthful health and vigor, she would need no more medicine at present.

C. A. BRUEGMANN, M. D., Marysville, Neb.

# A WORD
## ON
# MALT EXTRACTS

**The Physician's province is not invaded by the solicitation of lay custom for our malt products.**

**Our Malt Preparations are Medicinal Products to be dispensed by the Pharmacist as the Physician shall prescribe.**

A malt extract, properly speaking, is both a nutritive and a digestive—nutritive bacause of the presence in it of a large percentage of digested starch; and digestive by virtue of the diastase it contains. It should be remembered that in the administration of pre-digested foods the stomach is entirely relieved of the labor ordinarily incident to digestion, and the assimilation of the full quantity of nourishment introduced into the alimentary canal is thus assured. Malt extracts, as regards their digestive power, are valuable or not, according to the care exercised in their manufacture and the amount of diastase which they contain. This fortunately, is a matter capable of easy determination by estimating the action of a given quantity of any sample upon starch, under conditions similar to those which prevail during natural digestion.

We have devoted much time and study to the subject of digestives and their manufacture, and in introducing to your attention our malt extract we do so with the positive knowledge that it is at once a more active digestive and concentrated nutrient than any similar preparation now on the market.

Aside from the digestive and nutritive value of malt extract, its sweetness and palatability make it a valuable vehicle for the administration of remedies possessed of a disagreeable or nauseating taste.

## THE PROFESSION

Is respectfully requested to write for our literature upon Malt Extract and its combinations, particularly "A Word to the Medical Profession," which forcibly illustrates

## "What a Goodly Outside Falsehood Hath."

☞ Half-pound packages as samples to physicians who will indicate their willingness to defray expressage.

# SPECIAL NOTICE!

## A NEW MATERIA MEDICA.

For nearly two years the ORGANIC MATERIA MEDICA first issued by us in 1888, and a revised edition of which was printed in 1890, has been out of print, and we have not been able to supply copies.

We have, however, just issued another work which covers all the information contained in the original edition, but revised up to date, and with much new and interesting matter added.

The first 184 pages contain notes, in alphabetic order, of those articles of the Materia Medica of which we manufacture any preparation, giving therapeutic properties, doses, etc. Then follow the formulæ for making official preparations; much valuable information in the way of tables of weights and measures; weights and measures equivalents; tables of thermomentric equivalents; axioms in posology; thermomentry; treatment of children; incompatibility; Latin words and phrases; differential diagnosis of eruptive fevers; therapeutic suggestions, or diseases and their remedies; poisons and their antidotes; finally, a general index which will facilitate reference to any article under whatever title the reader may expect to find it.

We shall be pleased to send a copy, bound in stiff paper cover, to any physician or druggist on receipt of the actual cost of mailing, 10 cents, which may be remitted in postage stamps.

To any physician or druggist desiring the book bound in a more substantial cover and convenient manner, we will send a copy bound in cloth upon receipt of 25 cents in postage. *Applications should be addressed: Parke, Davis & Co., Box 468, Detroit Mich.*

# *Bedford Springs*

# *Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# PERFECT PILL PREPARATIONS

Of W. H. SCHIEFFELIN & Co., New York, we venture to suggest that, in prescribing, you specify "W. H. S. & Co.," as marked in the following brief, but always seasonable, selections from our lists:

## Pil. Phenacetine et Salophen
### "W. H. S. & Co."

For Influenza, (La Grippe,) Acute Rheumatism, Neuralgia, Migraine, Pertussis, and all painful febrile conditions. (Pills of 5 grains each, containing 2½ grains each of Phenacetine-Bayer and Salophen; half strength also.)

## Pil. Terpin Hydrat
### "W. H. S. & Co."

For Coughs, Colds, Catarrh, Bronchitis and all Acute and Chronic Respiratory Maladies. No unpleasant symptoms follow the continuous use of Terpin Hydrat. (Pills of 2 and 5 grains each.)

## Pil. Ferri, Quiniae et Strychniae
### "W. H. S. & Co."

For the various forms of Asthenia, and especially for slow Convalescence from Acute Maladies. An excellent pill for the Debility following Malaria. (Pills of 2 1-60 grains each.)

## Pil. Phenacetine-Bayer
### "W. H. S. & Co."

For All Forms of Fever, Pain, Rheumatism and Neuralgia; for Pertussis, and for conditions in which both pain and fever are to be combated. (Pills of 2, 3, 4 and 5 grains each.)

## Pil. Aloin, Strychniae et Belladonnae
### "W. H. S. & Co."

For Constipation dependent upon Lack of Tone in the Digestive Organs. It is useful also as an Occasional Laxative and well liked by Patients.

## Pil. Quiniae, Ferri et Zinci Valerianat
### "W. H. S. & Co."

For Nervous Tension, Melancholia, Epilepsy, Hysteria, Delirium Tremens, Dysmenorrhœa, and all Neuroses dependent upon the cares of life. (Pills of 3 grains.)

**W. H. Schieffelin & Co., New York.**

# NOTE THE FOLLOWING.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well-known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

Medical Department of the Western University of Pennsylvania.

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## University of Maryland,

FACULTY OF PHYSIC,

BALTIMORE, MD.

The Eighty-Seventh Annual Session commences October 2d, 1893, and ends in April, 1894. Large amount of clinical material, and ample facilities for work in chemical and histological laboratories and in the dissecting room. Each graduate has personal experience in obstetrics.

For Catalogue and other information, address

Dr. J. EDWIN MICHAEL,
201 W. Franklin St., Baltimore.

DENTAL DEPARTMENT.

Session begins October 2d, 1893. For Catalogue, address

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks**, M. D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on LYSOL, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :

This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :

The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

## SCHERING & GLATZ,

**Sole Representatives in the United States for Chemische Fabrik auf Actien, vorm. E. Schering, BERLIN, Germany.**

**55 MAIDEN LANE, NEW YORK.**

**PAMPHLETS FURNISHED ON APPLICATION.**

# NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of the forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, ***TO INCREASE THE NERVE CAPITAL OF YOUR PATIENT.***

# DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity *when* its supplying nerve is disordered *by lowered tone,* but this fact is largely ignored in these modern pepsin days—the *cause* being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of *the neurotic* patient. Hence, in treating dyspsepia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are *two distinct* ***INDICATIONS,*** one is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

**RIO CHEMICAL CO., St. Louis.**

# Phytoline

## A POWERFUL ANTI-FAT.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF PHYTOLACCA DECANDRA.

**PHYTOLINE** is the only Remdy that will absorb fatty tissue in a great degree without any evil after effects whatsoever. By its powerful though harmless action it replaces morbid tissue with solid flesh.

THIS STYLE ONLY.

FOR OBESITY AND FATTY DEGENERATION OF THE HEART, PRESCRIBE:

℞ *Phytoline (Walker) ℥ ii*

# Antiseptics and Disinfectants

## For the PREVENTION of CHOLERA.

THE prevention of diseases is the unselfish mission of the modern physician. Antiseptics and disinfectants to-day occupy the first place in medical and surgical practice. We desire to call attention to the following antiseptic and disinfectant preparations.

**Ethereal Antiseptic Soap** (Johnston's) is an ethereal hydro-alcoholic solution of Castile soap which was devised by an experienced nurse in the surgical clinic of the Jefferson Medical College. *Directions.*—After wetting the hands thoroughly, pour a drachm or two of the preparation into the palm of the hand, spread it well all over the hands, and rub as with ordinary soap, using sufficient water to produce a rich lather. Its fluidity insures contact with every portion of the hand and nails. Its marvelous cleansing power renders it a valuable adjunct in the armamentarium of the physician and surgeon. It may be made weak or strong in antiseptic value by dissolving mercuric chloride in it in proportions indicated in the case in hand. Since its introduction its use has been extended to the treatment of parasitic affections with gratifying success.

**Antiseptic Liquid** arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be advantageously used in cellars, barns, outhouses, and the sick-room. (Send for Note on the Disinfectant of the Future, by Prof. Alfred L. Loomis.)

**Antiseptic Tablets** are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

| *Formulas for Desirable Antiseptic Solutions:* | WINE MEASURE. | IMPERIAL MEASURE. |
|---|---|---|
| **1:1000**—Dissolve 1 tablet No. 180 in water | ( 4 fl. ozs.) | or ( 4 4-25 fl. ozs.) |
| or 1 tablet ℞ "B" in water | (16 fl. ozs.) | or (16 16-25 fl. ozs.) |
| **1:2000**—Dissolve 1 tablet No. 180 in water | ( 8 fl. ozs ) | or ( 8 8-25 fl. ozs.) |
| or 1 tablet ℞ "B" in water | (32 fl. ozs ) | or (33 7-25 fl. ozs.) |
| **1:4000**—Dissolve 1 tablet No. 180 in water | (16 fl. ozs.) | or (16 16-25 fl. ozs.) |
| or 1 tablet ℞ "B" in water | (64 fl. ozs.) | or (66 14-25 fl. ozs.) |

**Tablets of Yellow Oxide of Mercury,** containing two-hundredths of a grain of the oxide, are a valuable prophylactic against dysentery and enteric fever. They prevent fermentation and putrefaction, and render aseptic the alimentary tract.

**Eucalyptus and Thymol Antiseptic** is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited. It combines the antiseptic virtues of boric acid, menthol, oil eucalyptus, oil wintergreen, and thymol.

**Disinfectant Powder** possesses in a high degree disinfectant, absorbent, and antiseptic properties. It is admirably adapted for the disinfection of excreta in cholera, yellow fever, and typhoid fever, and in all diseases in which such an agent is indicated for the purpose specified. It is composed of: Copperas, dry; charcoal, fine powder; slaked lime; carbolic acid, com'l; naphthalin, com'l.

**Labarraque's Solution** we supply for the use of those who desire to employ it for its local antiseptic action. It may be diluted to suit the indications.

**Sulphur Candles.**—Each Candle contains one pound of sulphur. The value of sulphur fumigations in contagious diseases is too well understood by the medical profession to require much comment. However, it is not easy to ignite pure brimstone or to maintain its combustion. These Sulphur Candles are easily ignited and will continue to burn until consumed. Especially adapted for the disinfection of rooms in which there have been cases of scarlet fever, diphtheria, etc., etc.

**WE SHALL BE PLEASED TO FORWARD, ON REQUEST, ANY DESIRED INFORMATION CONCERNING THESE PRODUCTS.**

# PARKE, DAVIS & CO.,

**Detroit, New York, Kansas City, and Walkerville, Ont.**

ESTABLISHED 1855.

# DR. STRONG'S SANITARIUM,

## SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed

**For Treatment:** In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians

**For Change:** This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

**For Rest:** The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

**For Recreation:** To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

DR. S. E. STRONG, THE SANITARIUM, 90 CIRCULAR ST.

Phena Tro Cine

Physicians generally throughout the country are very much pleased with **THE NEW ANTIPYRETIC** and **ANALGESIC,** because unlike so many of the kindred remedies it never disappoints, but has most remarkable therapeutic effects. If you have not had a sample drop us a card, and we will be pleased to send it to you.

Price in one ounce cans (437½ grs.) **60 cents.**

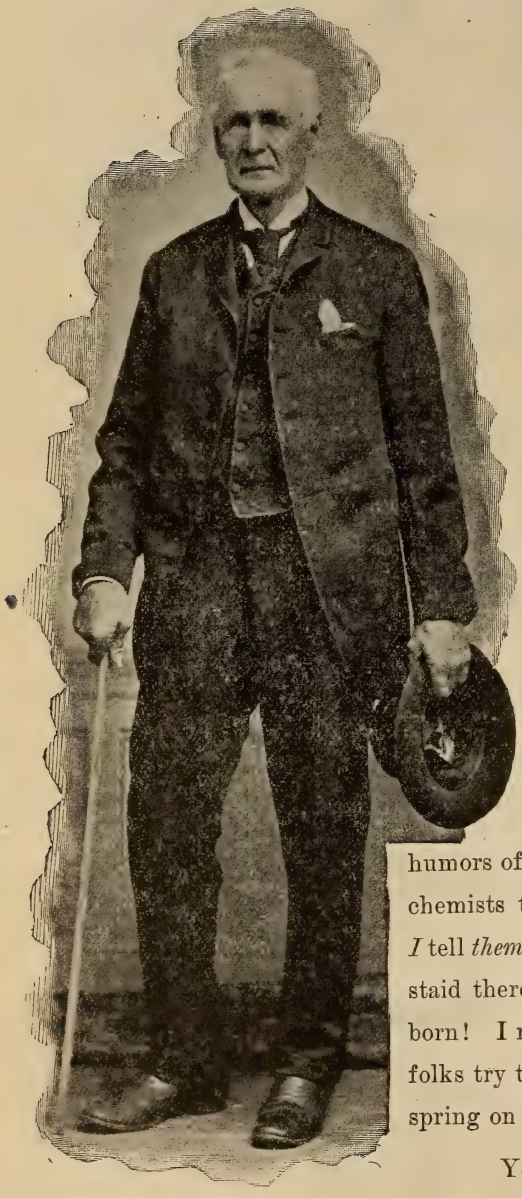
Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.



LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

TO THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.

Charles B. Perkins & Co., Selling Agts., 36 Kilby St., Boston.

# BROMIDIA.

Each fld. dr. contains 15 gr. *each* Pure Chloral Hydrat. and Purified Brom. Pot., and ⅛ gr. *each* Cannabis Indica and Hyoscyam. Dose—One-half to one fld. drachm in water or syrup.

# PAPINE.

The Anodyne principle of Opium; the narcotic and convulsive elements being eliminated. Dose—One fld. drachm, represents ⅛ gr. morphia in anodyne principle.

# IODIA.

A combination of active principles of Stillingia, Helonias, Saxifraga, Menispermum and Aromatics. Each fld. dr. contains 5 grs. Iod. Potas. and 3 grs. Phos. Iron. Dose—One or two fld. drachms as indicated.

# *Bedford Springs Mineral Water*

## NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

PREPARED ONLY BY

THE TILDEN COMPANY — NEW LEBANON · N. Y.

BRANCH HOUSE ST. LOUIS · MO.

SAMPLES FURNISHED ON APPLICATION.

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

---

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

# Dr. Unna's Plaster-Mulls

**Are prepared according to directions of the originator, Dr. P. G. UNNA, the eminent dermatologist, by P. BEIERSDORF & CO., Hamburg, Germany.**

**PLASTER-MULLS** are an ideal improvement on the ordinary spread plasters. The medicament is dissolved in a minimum quantity of a suitable vehicle, and is evenly spread on the thinnest possible layer of gutta-percha, backed by fine gauze (or mull). The gutta-percha layer hermetically seals the covered skin-surface and prevents transpiration (or exhalation) of the pores; thereby the medicament is more deeply absorbed, and the therapeutic effect is more intense and powerful. The stratum of plaster is very thin, consisting of a non-irritant vehicle and the medicament; the former in smallest possible proportion, and the latter in exact dosage perfectly dissolved, so that every particle will act its full remedial part. So perfect is this distribution of the medicament that every square piece, subdivision of a metre, will contain its exact proportion of the total quantity of medicament in a metre roll. Exact dosage and effect is thus guaranteed. The gutta-percha being elastic and pliable, the Plaster-Mulls allow of closest affinity to the skin, and any part of the body can be perfectly covered without necessity for cutting the plaster. Thus, in every particular these Plaster-Mulls are vastly superior to the old-style thickly-spread plasters and ointments.

These Plaster-Mulls have been used and favorably endorsed by many authorities, such as:

| | |
|---|---|
| NEGA, | MORRISON, |
| WILL, | J. C. MCGUIRE. |
| JANOWSKY, | SCHWIMMER, |
| MCCALL ANDERSON, | CHOTZEN, |

## Buffalo Lithia Water

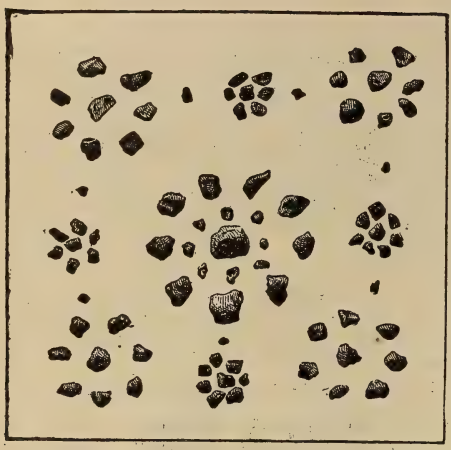

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# GESTATION.

WHEN women have miscarried during previous pregnancies, or in any case where miscarriage is feared, ALETRIS CORDIAL is indicated, and should be continuously administered during entire gestation.

I can heartily endorse ALETRIS CORDIAL, after giving it a fair trial. Mrs. F., aged 37, mother of two children, during last seven years has miscarried three times. Has lateral curvature of spine, and was never robust. Began, in last gestation, at four months to give ALETRIS CORDIAL, three-quarter teaspoonful three times a day, and increased to one teaspoonful. She has used four half-pound bottles, and is now within four or five days of full term. Her general health has been much improved, appetite good, no vomiting, bowels in good condition, kidneys acting well. I am exceedingly well pleased with the action of the remedy, as is also my patient. I have also used ALETRIS CORDIAL in ovarian neuralgia, with tip-top results. I have used it in one case of miscarriage at three months, in which the catamenia almost amounted to flooding, confining the patient to bed for six or eight days at a time. In this case I prescribed:

R. Aletris Cordial ..... 8 ounces.
Ergot, Fl. Ext. ..... 2 ounces.
M. Sig. Teaspoonful three or four times a day.

This acted promptly, and the next period was passed in comparative comfort.

E. L. FISH, M. D., West Valley, N. Y.

I have much pleasure in expressing my satisfaction with the results I have obtained by the use of ALETRIS CORDIAL. One of my patients who had miscarried three times previously, took ALETRIS CORDIAL during the last three months of pregnancy, and was delivered of a fine, healthy boy. I ordered it at her own solicitation, as she expressed so much ease and comfort after the use of the first bottle. I am now giving it to two more patients, who have miscarried several times before, and am in hopes of good results. I consider it a valuable addition to the Pharmacopœia, on account of its antispasmodic and nerve-tonic properties, and should not like to be without it.

M. D. MAKUNA, M.R.C.S.,
Trebeebut, Rhondda Valley, South Wales.

I used ALETRIS CORDIAL in a case of painful menstruation. It was most valuable. The wife of a minister suffered much, and had had three miscarriages. Prescribed ALETRIS CORDIAL. She has, for the first time, gone her full time, and was safely confined with a male child. I also prescribed it to a relative, suffering with leucorrhea for years. Great relief from pain, and the discharge much less. In the first case related it was truly a God-send.

R. REECE, M.R.C.S. Eng., 1851, L.S.A., 1832,
Walton-on-Thames, England.

I tried ALETRIS CORDIAL on a patient who had twice previously miscarried, and she went to full term.

C. T. NUGENT, M. D., Bertrand, La.

A full size bottle of ALETRIS CORDIAL will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

# Treatment of Cholera.

**Dr. Chas. Gatchell,** of Chicago, in his "*Treatment of Cholera*," says: "As it is known that the cholera microbe does not flourish in acid solutions, it would be well to slightly acidulate the drinking water. This may be done by adding to each glass of water half a teaspoonful of **Horsford's Acid Phosphate.** This will not only render the water of an acid reaction, but also render boiled water more agreeable to the taste. It may be sweetened if desired. The **Acid Phosphate,** taken as recommended, will also tend to invigorate the system and correct debility, thus giving increased power of resistance to disease. It is the acid of the system, a product of the gastric functions, and hence, will not create that disturbance liable to follow the use of mineral acids."

**Send for descriptive circular. Physicians who wish to test it will be furnshed, upon application, with a sample, by mail, or a full sized bottle without expense, except express charges. Prepared under the direction of Prof. E. N. Horsford, by the**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## CALIFORNIA FIG SYRUP COMPANY

## SAN FRANCISCO, CAL.

## LOUISVILLE, KY. NEW YORK, N. Y.

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

*MELLIER DRUG CO NO 109 WALNUT ST. ST LOUIS MO.*

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails.

A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc.

THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

MAIL US YOUR Name and Address and we will send book of TESTIMONIALS.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

TO THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.

Charles B. Perkins & Co., Selling Agts., 36 Kilby St., Boston.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.
Per case of half-dozen Bottles, $6.00.
Per case of One Dozen Bottles, 12.00.

## MEDICAL DEPARTMENT OF THE COLUMBIAN UNIVERSITY.

WASHINGTON, D. C.

### ANNOUNCEMENT, 1893—'94.

The Seventy-second Session will begin October 1st, 1893, and continue seven months. Graded four year course required. Ample clinical facilities.

FACULTY:

J. F. THOMPSON, Surgery.
W. W. JOHNSTON, Practice.
A. F. A. KING, Obstetrics.
E. A. DE SCHWEINITZ, Chemistry.
WM. P. CARR, Physiology.
D. W. PRENTISS, Therapeutics.
D. K. SHUTE, Anatomy.
H. C. YARROW, Dermatology.
G. B. HARRISON, Pediatrics.
THEO. SMITH, Bacteriology and Hygiene.
T. E. McARDLE, Minor Surgery.
H. L. E. JOHNSON, Gynæcology.
G. N. ACKER, Pathological Histology.
W. M. GRAY, Normal Histology.
W. K. BUTLER, Ophthalmology.
S. RUFFIN, Medical Jurisprudence.
C. W. RICHARDSON, Laryngology and Otology.
A. C. PATTERSON, Mental Diseases.
E. L. TOMPKINS, Neurology.

For circulars, address **A. F. A. KING, M. D., Dean,**
1315 Massachussets Avenue, N. W., Washington, D. C.

## TERRACE BANK SANITORIUM

Dr. R. S. Sutton's Private Institution for the Treatment of Surgical Diseases of Women.

PERFECT SANITARY AND ASEPTIC ARRANGEMENTS, and provided with all Modern Conveniences, Address

AMERICAN LIGHTNING PROTECTION CO.,
874 Broadway, New York.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address
DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

## WALNUT LODGE HOSPITAL

**HARTFORD, CONNECTICUT.**

Organized in 1880 for the special medical treatment of
**ALCOHOL AND OPIUM INEBRIATES.**

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
**Sup't Walnut Lodge, Hartford, Conn.**

## University of Maryland,

**FACULTY OF PHYSIC,**

**BALTIMORE, MD.**

The Eighty-Seventh Annual Session commences October 2d, 1893, and ends in April, 1894. Large amount of clinical material, and ample facilities for work in chemical and histological laboratories and in the dissecting room. Each graduate has personal experience in obstetrics.

For Catalogue and other information, address

**Dr. J. EDWIN MICHAEL,**
**201 W. Franklin St., Baltimore.**

### DENTAL DEPARTMENT.

Session begins October 2d, 1893. For Catalogue, address
DR. F. J. S. GORGAS, Dean,
845 N. Eutaw Street, Baltimore.

## THE JEFFERSON MEDICAL COLLEGE OF PHILADELPHIA.

**The Annual Session of the Jefferson Medical College begins October 2d, and continues over seven months. Preliminary Lectures will be held from 25th of September.**

### COURSE OF INSTRUCTION AND FACILITIES.

Three years of graded instruction are required of candidates presenting themselves for the degree of M. D., but the voluntary fourth-year course which is now offered is strongly recommended. The instruction consists in didactic lectures, amply supplemented by clinical teaching at the bedside and in the laboratories and dispensaries.

In addition to the members of the Faculty there is a large corps of experienced instructors who assist the professors in practical work in the laboratories or in bedside work at the hospitals and dispensaries. Every student is personally taught, by dividing the class into small sections.

Daily instruction in the practical branches is given in the Hospital of the College, is a special feature of the course in the second and third years, and is without extra charge.

The Annual Announcement, giving full particulars, will be sent on application to

**J. W. HOLLAND, M. D., Dean.**

# SALIPYRIN-RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI-RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on LYSOL, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

**THE COLUMBIA CHEMICAL CO.**
**90 SOUTH FIFTH AVE., NEW YORK.**

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.**

This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.**

The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

## SCHERING & GLATZ,

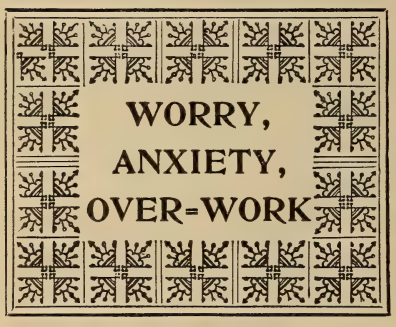
**Sole Representatives in the United States for Chemische Fabrik auf Actien, vorm. E. Schering, BERLIN, Germany.**

**55 MAIDEN LANE, NEW YORK.**

**PAMPHLETS FURNISHED ON APPLICATION.**

# BRAIN-FAG!

BRAIN FAG is an expression used to convey the idea of that condition of the brain where it is tired, worn out or broken down from various causes, such as worry, anxiety, over-work and excesses of various kinds. In cases of this kind the first impulse is to resort to stimulants, which may give temporary relief, but wherever there is stimulation there is bound to be a reaction which leaves the sufferers in a far worse condition than they were before. . . . . .



# CELERINA!

What we want in these cases is a brain food combined with a stimulant that will not react. Stimulation without reaction is apparently an anomaly, but the experience of the medical profession all over the world proves that in CELERINA we have such a combination. Besides being a gentle and natural stimulant, it also serves as a food to the shattered nervous system, and soon restores and maintains it in its normal condition.

A full size bottle of CELERINA will be sent free to any Physician who wishes to test it if he will pay the express charges.

**RIO CHEMICAL CO., St. Louis.**

FOR POSTAGE. WE WOULD SUGGEST HOWEVER THAT YOUR DRUGGIST ORDER A SUPPLY FOR YOUR PRESCRIPTIONS. A. Lambrecht, del

# HYGIENIC AGENTS.

Dietetic Waters, more generally called Table Waters, *if pure,* are of great value as hygienic agents, says the N. Y. MEDICAL JOURNAL.

The lay public, however, are apt to confound Table Waters with Medicinal Waters containing active chemical substances which cannot safely be included as part of the ordinary daily diet.

The BRITISH MEDICAL JOURNAL says that Apollinaris *reigns alone* among Natural Dietetic Table Waters.

For Pamphlets,

ADDRESS CHARLES GRAEF & CO., 32 BEAVER STREET, NEW YORK.

# ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alternatives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequaled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alternatives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.]

Among laxatives we have many formulæ. As a general laxative Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that nature cannot alone restore lost function. The duty of the modern doctor to the patient is, in prescribing, to specify drugs the purity of drugs he can vouch for.

The pharmacist of to-day appreciates the necessity of keeping in stock salable specialties, unprotected by patent or proprietory interest in them, to meet the requirements for pure palatable products.

*We invite correspondence from the pharmaceutical profession concerning our products, and will afford all information regarding them desired.*

## PARKE, DAVIS & CO.,

DETROIT, NEW YORK, KANSAS CITY, AND WALKERVILLE, ONT.

ESTABLISHED 1855.

# DR. STRONG'S SANITARIUM,

## SARATOGA SPRINGS, NEW YORK,

Receives persons recommended to it by their home physicians for TREATMENT, CHANGE, REST, OR RECREATION.

And places them under well-regulated hygienic conditions so helpful in the treatment of chronic invalids or the overtaxed

**For Treatment:** In addition to the ordinary remedial agents, it has a Sun Parlor and Promenade on the roof. Turkish, Roman, Sulphur, Electro-Thermal, the French Douche, and all Hydropathic Baths; Vacuum Treatment, Swedish Movements, Massage, Pneumatic Cabinet Inhalations of Medicated, Compressed, and Rarefied Air, Electricity in various forms, Thermo-Cautery, Calisthenics, and Saratoga Waters, under the direction of a staff of educated physicians.

**For Change:** This Institution is located in a phenomenally dry, tonic, and quiet atmosphere, in the lower arc of the Adirondack zone, and within the "Snow Belt."

**For Rest:** The Institution offers a well-regulated, quiet home, with elevator, electric bells, open fire-places, steam, and thorough ventilation. With cheering influences and avoiding the pressing atmosphere of invalidism.

**For Recreation:** To prevent introspection, are household sports at all seasons of the year, and in winter tobogganing, elegant sleighing, etc.; in Summer, croquet, lawn-tennis, etc.

Private professional references furnished upon application. Physicians are invited to inspect the Institution at their convenience.

A liberal discount to physicians and their families for board or treatment. For illustrated Circular, Address:

# *Bedford Springs Mineral Water*

## NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

**The Springs Hotel is open from June until October.**

*who, in addition to the remedies herewith described, prepare* SULFONAL-BAYER, SALOPHEN, LOSOPHAN *and* ARISTOL.

# Europhen

AS A COMPLETE SUBSTITUTE for IODOFORM no remedy is comparable to Europhen. It is the best known cicatrisant for open wounds, and catarrhal or ulcerative lesions, whether or not of a specific character; and it has a special value in cavital lesions.

EUROPHEN has five times more covering power than iodoform and adheres to denuded surfaces. It is supplied in ounces, pure, or mixed in equal proportions with Aristol.

# Phenacetine
## (BAYER)

THIS WELL KNOWN REMEDY has justified in the most exceptional manner the opinions of medical men touching its value in modern therapeutics. Phenacetine is indicated in all acute, inflammatory, febrile conditions, and all forms of pain. It is the safest, while the most active, of the antipyretics and analgesics.

PHENACETINE is supplied in *ounces, tablets* and *pills*; also in various combinations with Salophen. Sulfonal, etc.

# Piperazine
## (BAYER)

FOR LITHIASIS, acute and chronic gout, uric acid dyscrasia, and the gouty diathesis generally, no remedy has succeeded so well as PIPERAZINE. In Renal Colic and Urinary Hemorrhage, also, it is especially efficacious. PIPERAZINE-BAYER is made by a new process whereby its cost is greatly reduced.

PIPERAZINE-BAYER is supplied in *half ounces, ounces* and *tablets*. In painful conditions it may be combined with Phenacetine.

# Trional

TRIONAL is a nerve sedative and hypnotic which has given very satisfactory results in cases not amenable to treatment by other drugs. It is peculiarly valuable in cases of slight psychical excitement accompanied by obstinate insomnia. It acts promptly and is useful in many forms of delirium.

TRIONAL is administered in doses of 15 to 30 grains. Where pain is present Trional may be given conjointly with Phenacetine. *Supplied in ounces.*

*Physicians who wish to have the published testimony concerning the therapeutic action of these preparations, or information as to their chemistry or physiological action, should address*

**Sole Agents** — **W. H. Schieffelin & Co.,** NEW YORK. — **For the U. S.**

# NOTE THE FOLLOWING.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

SMITH, KLINE & FRENCH CO., PHILADELPHIA.

# Dr. Unna's Plaster-Mulls

Are prepared according to directions of the originator, Dr. P. G. UNNA, the eminent dermatologist, by P. BEIERSDORF & CO., Hamburg, Germany.

PLASTER-MULLS are an ideal improvement on the ordinary spread plasters. The medicament is dissolved in a minimum quantity of a suitable vehicle, and is evenly spread on the thinnest possible layer of gutta-percha, backed by fine gauze (or mull). The gutta-percha layer hermetically seals the covered skin-surface and prevents transpiration (or exhalation) of the pores; thereby the medicament is more deeply absorbed, and the therapeutic effect is more intense and powerful. The stratum of plaster is very thin, consisting of a non-irritant vehicle and the medicament; the former in smallest possible proportion, and the latter in exact dosage perfectly dissolved, so that every particle will act its full remedial part. So perfect is this distribution of the medicament that every square piece, subdivision of a metre, will contain its exact proportion of the total quantity of medicament in a metre roll. Exact dosage and effect is thus guaranteed. The gutta-percha being elastic and pliable, the Plaster-Mulls allow of closest affinity to the skin, and any part of the body can be perfectly covered without necessity for cutting the plaster. Thus, in every particular these Plaster-Mulls are vastly superior to the old-style thickly-spread plasters and ointments.

These Plaster-Mulls have been used and favorably endorsed by many authorities, such as:

NEGA, MORRISON,
WILL, J. C. MCGUIRE.
JANOWSKY, SCHWIMMER,
MCCALL ANDERSON, CHOTZEN,
FRANK, BULKLEY,
BORCK, and many others.

We are now prepared to supply Plaster-Mulls in 1 metre canisters; circulars giving list of medicaments, indications, etc., mailed free on receipt.

**Sole Agents for America:**

**LEHN & FINK, NEW YORK**

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

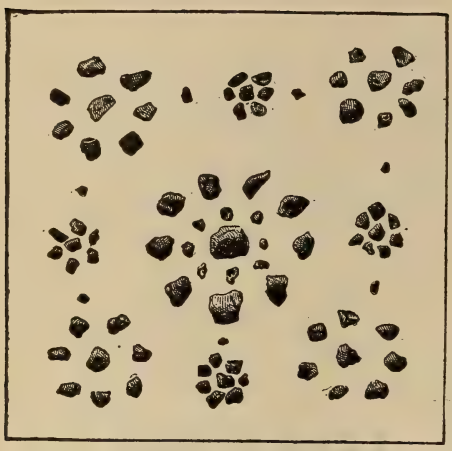

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# STERILITY.

I know of nothing with which I have had better success, in treating the various diseases peculiar to the female, than ALETRIS CORDIAL. I have used it in amenorrhea and dysmenorrhea, with excellent results, and also in ovarian and uterine congestion, whether from cold or otherwise, I know of no better remedy. Mr. L. consulted me about his wife. Had been married four years, and had no children. He was a strong, healthy man, about 28 years of age, and his wife 24. He was very anxious that there should be an increase in the family, and had two other physicians at different times, giving her medicine for that purpose. I ascertained that she suffered very much with her menses, and frequently had to take to her bed during the time. They were sometimes very scant, and at others rather profuse. When consulted it was a week before her menses should appear. Prescribed:

R. Aletris Cordial..... 8 ounces.
Sig. One teaspoonful three times a day.

The husband reported that his wife had the easiest time she had ever experienced, and suffered no pain. When the next time came, the menses did not appear; two bottles of ALETRIS CORDIAL were taken, and in regular time they were made happy by the advent of a bright, bouncing girl. The above is one of several cases of the same kind I have had in my practice. I have been prescribing ALETRIS CORDIAL in my practice for about five years, and from its use during that time I have certainly had an opportunity of testing it very well, both singly and combined. When treating females of a weak, nervous and hysterical condition, caused from uterine derangements, the following will relieve in nearly every case:

R. Aletris Cordial..... 8 ounces.
Celerina..... 8 ounces.
M. Sig. Two teaspoonfuls three or four times a day.

JAS. P. PEELER, M. D., Kissimmee City, Fla.

*A full size bottle of ALETRIS CORDIAL will be sent FREE to any Physician wishing to test it if he will pay the express charges.*

# *Bedford Springs*

# *Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

---

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

## RECENT OPINIONS:

"There is a great deal of thoughtful and instructive matter in the British Magazines and reviews of which the reader should not be ignorant. In order to get access to this matter, the cheapest and most convenient way is to subscribe to LITTELL'S LIVING AGE, Boston's weekly eclectic, in which will always be found the cream of the foreign periodicals."—*The Times-Union*, Albany, N. Y.

"Only the best has ever filled its pages; the best thought, rendered in the purest English. Nothing poor or unworthy has ever appeared in the columns of THE LIVING AGE."—*The Presbyterian*, Philadelphia.

"We have almost exhausted our terms of praise in speaking of this weekly magazine, but we commend it as heartily as ever as a grand repository of the literature of the age."—*N. Y. Observer*.

"One may find here all that is worth his while to know of foreign literature in all its departments."—*Advance*, Chicago.

"Full of vitality and interest."—*Journal*, Boston.

**Published Weekly at $8.00 a year, free of postage. Sample copies, 15c. each.**

**CLUB PRICES FOR THE BEST HOME AND FOREIGN LITERATURE.**

["Possessed of LITTELL'S LIVING AGE, and of one or other of our vivacious American monthlies, a subscriber will find himself *in command of the whole situation.*"—*Philadelphia Evening Bulletin.*]

For $11.25, THE LIVING AGE and *The Arena*, or *The Forum*, or *Gaillard's Medical Journal* or the *Magazine of American History* will be sent, postpaid, for one year.

For $10.50, THE LIVING AGE and any one of the *four-dollar* monthly magazines (or *Harper's Weekly* or *Bazaar*) will be sent for a year, postpaid; or, for $9.50, THE LIVING AGE and *Scribner's Magazine*, or the *St. Nicholas*; or for $9.25, THE LIVING AGE and *Lippincott's Magazine*, or *Poet Lore*, or *Review of Reviews.*

Rates for clubbing THE LIVING AGE with more than one other periodical will be sent on application.

## BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles**, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## THE BALTIMORE MEDICAL COLLEGE.

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on LYSOL, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

**90 SOUTH FIFTH AVE., NEW YORK.**

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :

This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :

The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**

Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

# AFTER
# THE REMOVAL OF ALCOHOL - -

In the treatment of the inebriate, a stage of profound exhaustion and neurasthenia comes on. An unmasking, as it were, of a nameless variety of neuralgias and states of irritation, both physical and psychical, which tax therapeutic resources to its utmost to meet. Functional changes and perversions that are intense, complex and very changeable, associated with organic lesions, both obscure and well defined, not only difficult to diagnose, but more difficult to treat. These are termed, in general, states of brain and nerve exhaustion, and the usual remedies are quinine, strychnine, electricity, baths, nutrients, and other general remedies. The materia medica is constantly searched for tonics that will lessen this neurasthenic stage, and enable the patient to regain in some measure his lost control of mind and body, and rise above the mental depressions so common and agonizing. The experience of the medical profession proves that Celerina meets these wants more positively than any other remedy.

# ELIGIBLE MEDICINAL SPECIALTIES.

Among remedies which are always in demand are alternatives, laxatives, and tonics.

We have a most eligible and therapeutically satisfactory line of these, and we claim that our facilities for securing the highest quality of drugs and their preparation are unequaled. We guarantee every unopened package from our laboratory absolutely as represented.

Among these classes of preparations we may commend especially as tonics, Coca Cordial, Pepsin Cordial, Esencia de Calisaya, Weld's Syrup of Chloride of Iron.

Of the alternatives, Syrup Trifolium Compound, Syrup of Hydriodic Acid [2 per cent.]

Among laxatives we have many formulæ. As a general laxative Cascara Sagrada stands easily first. Many of the laxative formulæ meet special indications.

History, literature, and all experience indicate that Medication has to play its part, and that nature cannot alone restore lost function. The duty of the modern doctor to the patient is, in prescribing, to specify drugs the purity of drugs he can vouch for.

The pharmacist of to-day appreciates the necessity of keeping in stock salable specialties, unprotected by patent or proprietory interest in them, to meet the requirements for pure palatable products.

*We invite correspondence from the pharmaceutical profession concerning our products, and will afford all information regarding them desired.*

# *Bedford Springs Mineral Water*

## NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

**The Springs Hotel is open from June until October.**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

DOSE ONE TEASPOONFUL BEFORE MEALS

PREPARED ONLY BY THE **TILDEN COMPANY** NEW LEBANON N.Y.
BRANCH, ST. LOUIS, MO.

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

# Dr. Unna's Plaster-Mulls

Are prepared according to directions of the originator, Dr. P. G. UNNA, the eminent dermatologist, by P. BEIERSDORF & CO., Hamburg, Germany.

PLASTER-MULLS are an ideal improvement on the ordinary spread plasters. The medicament is dissolved in a minimum quantity of a suitable vehicle, and is evenly spread on the thinnest possible layer of gutta-percha, backed by fine gauze (or mull). The gutta-percha layer hermetically seals the covered skin-surface and prevents transpiration (or exhalation) of the pores; thereby the medicament is more deeply absorbed, and the therapeutic effect is more intense and powerful. The stratum of plaster is very thin, consisting of a non-irritant vehicle and the medicament; the former in smallest possible proportion, and the latter in exact dosage perfectly dissolved, so that every particle will act its full remedial part. So perfect is this distribution of the medicament that every square piece, subdivision of a metre, will contain its exact proportion of the total quantity of medicament in a metre roll. Exact dosage and effect is thus guaranteed. The gutta-percha being elastic and pliable, the Plaster-Mulls allow of closest affinity to the skin, and any part of the body can be perfectly covered without necessity for cutting the plaster. Thus, in every particular these Plaster-Mulls are vastly superior to the old-style thickly-spread plasters and ointments.

These Plaster-Mulls have been used and favorably endorsed by many authorities, such as:

NEGA, MORRISON,
WILL, J. C. MCGUIRE.
JANOWSKY, SCHWIMMER,
MCCALL ANDERSON, CHOTZEN,
FRANK, BULKLEY,
BORCK, and many others.

We are now prepared to supply Plaster-Mulls in 1 metre canisters; circulars giving list of medicaments, indications, etc., mailed free on receipt.

**Sole Agents for America:**

**LEHN & FINK, NEW YORK**

## Descriptive Price-List of Dr. Unna's Plaster-Mulls.

| No. | Medicament. | Strength in Grams per Roll. (1 Metre x 20 CM.) | Indications. | Selling Price. |
|---|---|---|---|---|
| 10 | Salicylic Acid . | 10 (or $\frac{1}{30}$ gr. per sq. inch) | Keratonosis (Clavi), Scleroderma. | |
| 15 | Mercury . . . . . | 20 (or $\frac{1}{15}$ gr. " " ) | Lues, Bubones, etc. | |
| 16 | Mercury and . . Carbolic Acid. | 20 (or $\frac{1}{15}$ gr. " " ) 7.5 (or $\frac{1}{40}$ gr. " " ) | Furunculosis, Acne, Ulcera cruris, Bubones. | |
| 24 | Oxide Zinc . . . | 10 (or $\frac{1}{30}$ gr. " " ) | Eczema, to prevent Decubitus, to fix permanent bandages, to protect abrasions and cut wounds. | |
| 27 | Oxide Zinc . . . and Tar . . . . . | 10 (or $\frac{1}{30}$ gr. " " ) 5 (or $\frac{1}{60}$ gr. " " ) | Eczema chronic, etc. | |
| 66 | Ichthyol . . . . . | 10 (or $\frac{1}{30}$ gr. " " ) | Rheumatism, etc. | |
| 72 | Resorcin . . . . . | 15 (or $\frac{1}{20}$ gr. " " ) | Acne, Furunculosis, Rosacea, Eczema chron. | |
| 76 | Salicylic Acid . and Creasote . | 10 (or $\frac{1}{30}$ gr. " " ) 20 (or $\frac{1}{15}$ gr. " " ) | Lupus, etc. | |
| 78 | Salicylic Acid . and Creasote . | 20 (or $\frac{1}{15}$ gr. " " ) 40 (or $\frac{2}{15}$ gr. " " ) | Lupus, etc. | |

The above quoted assortment we now carry regularly in stock; other medicaments and combinations will be added as the demand increases. We are prepared to furnish other or special medicaments on short notice—two weeks if ordered by cable, three weeks by mail. Physicians are invited to investigate the merits of these Plaster-Mulls; a trial is sure to merit continued preference.

**LEHN & FINK, Sole Agents, 128 William Street, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process,**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVE., NEW YORK.***

# 12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

# Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation."**

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

**THE COLUMBIA CHEMICAL CO.,**
**90 South Fifth Avenue, New York.**

# *Bedford Springs*

# *Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

**The Springs Hotel is open from June until October.**

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

# EVERY PHYSICIAN

has a certain class of patients who worry him a good deal, for while not being exactly ill or confined to their beds, they are always complaining of a feeling of depression, loss of energy, restlessness, insomnia and a general feeling of "je ne sais quoi;" and while these symptoms may indicate a certain form of neurosis or nervous debility, he is at a loss as to what to prescribe, for while there are numerous remedies for nervous diseases, he is often puzzled as to which to use. It is in this class of cases that CELERINA, a combination of Celery, Coca, Kola and Viburnum, is indicated, for while not acting as an unnatural stimulus, it soon restores the tired and jaded nervous system to its normal condition, and brings about a feeling of buoyancy and energy that will be pleasing and surprising to both physician and patient, and will induce him to confirm the verdict of his brethren all over the world as to the virtues of this preparation. It is put up in elegant and palatable form, and being made of the best material in large quantities, it is always uniform and certain in its results.

*A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.*

# Treatment of Cholera.

**Dr. Chas. Gatchell,** of Chicago, in his "*Treatment of Cholera,*" says: "As it is known that the cholera microbe does not flourish in acid solutions, it would be well to slightly acidulate the drinking water. This may be done by adding to each glass of water half a teaspoonful of **Horsford's Acid Phosphate.** This will not only render the water of an acid reaction, but also render boiled water more agreeable to the taste. It may be sweetened if desired. The **Acid Phosphate,** taken as recommended, will also tend to invigorate the system and correct debility, thus giving increased power of resistance to disease. It is the acid of the system, a product of the gastric functions, and hence, will not create that disturbance liable to follow the use of mineral acids."

**Send for descriptive circular. Physicians who wish to test it will be furnshed, upon application, with a sample, by mail, or a full sized bottle without expense, except express charges. Prepared under the direction of Prof. E. N. Horsford, by the**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## Buffalo Lithia Water

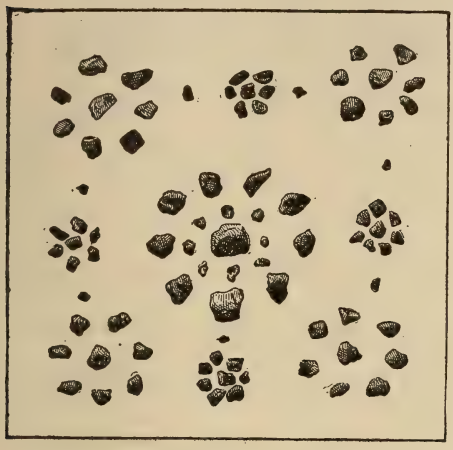

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

# Mellin's Food

## For Infants and Invalids.

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, Metcalf's Coca Wine acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, $6.00
Per case of One Dozen Bottles, 12.00.

## THE JEFFERSON MEDICAL COLLEGE OF PHILADELPHIA.

**The Annual Session of the Jefferson Medical College begins October 2d, and continues over seven months. Preliminary Lectures will be held from 25th of September.**

### COURSE OF INSTRUCTION AND FACILITIES.

Three years of graded instruction are required of candidates presenting themselves for the degree of M. D., but the voluntary fourth-year course which is now offered is strongly recommended. The instruction consists in didactic lectures, amply supplemented by clinical teaching at the bedside and in the laboratories and dispensaries.

In addition to the members of the Faculty there is a large corps of experienced instructors who assist the professors in practical work in the laboratories or in bedside work at the hospitals and dispensaries. Every student is personally taught, by dividing the class into small sections.

Daily instruction in the practical branches is given in the Hospital of the College, is a special feature of the course in the second and third years, and is without extra charge.

The Annual Announcement, giving full particulars, will be sent on application to

**J. W. HOLLAND, M. D., Dean.**

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## University of Maryland,

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks**, M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on LYSOL, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVENUE, NEW YORK.***

# 12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

# Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation."**

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

**SCHERING'S**

# FORMALIN

**THE NEW HARMLESS GERMICIDE**

Has a germicidal action superior to Corrosive Sublimate without its toxicity.

**THIS LIQUID MIXES IN ALL PROPORTIONS WITH WATER**

At ordinary temperature even, FORMALIN gives off Gaseous, Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. Stahl, Berlioz, and Frillat, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. Stahl's observations that after one hour's exposure to one per mille, or a quarter of an hour's exposure to $1\frac{1}{3}$ per mille solution of FORMALIN, the most resistant forms of micro-organisms were destroyed. FORMALIN, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

FORMALIN may be applied in 1 per cent. solutions, by spray diffusers, without damage to furniture, metal or materials.

FORMALIN is supplied in one pound bottles.

# NERVES.

Suppose we find the patient a little giddy upon rising in the morning. This means that the nerves do not have perfect control of the muscular system. As a test for this, direct the patient to stand with his feet close together, shut his eyes, and if the tendency is to reel, it is another evidence of lowered nerve tone. Or, stand with the arms extended, shut the eyes, and then try to bring the tips of his forefingers together in front of him. If they pass by or meet imperfectly, it shows the same thing.

Or, the person may not be able to think as quickly as he should. To test this, ask the patient three simple questions in rapid succession, as, Where were you just before you came into this room? What were you doing? How long did you remain? The rapidity with which the answers are given indicate the rapidity of brain action.

All these things show that it is of the utmost importance that the nervous system should be kept in tone. Otherwise, every part of the body languishes.

This condition indicates the use of Celerina (Rio) in teaspoonful doses four times a day, *to increase the nerve capital of your patient.*

# Phytoline

## A POWERFUL ANTI-FAT.

Phytoline is now recognized by the Medical Profession as being the only remedy in the Treatment of Obesity that will absorbe the fatty tissue in a great degree without any evil after-effects whatsoever.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles,** by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

# *Bedford Springs Mineral Water*

## NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

**The Springs Hotel is open from June until October.**

# FIRWEIN! The Ideal Expectorant

## WHY?

1. IT CONTAINS all the essential ingredients to relieve Coughs.
2. IT IS COMPOSED of the Balsams associated with Phosphorus, Iodine and Bromine.
3. EXPERIENCE has verified the effectiveness of the combination.
4. IT CAN BE GIVEN IN ALL cases where Cod Liver Oil is prescribed.

## DISEASES

where prescribed and found unsurpassed.

ACUTE AND CHRONIC BRONCHITIS

LARYNGITIS,

PNEUMONIA,

ASTHMA and

PULMONARY TUBERCULOSIS

**DOSE:** One or Two Teaspoonfuls before meals, or oftener, regulated by age or disease
FORMULÆ: Each fluid drachm contains Phosphorus 1-100 of a grain; Iodine, 1-6 of a grain; Bromine, 1-6 grain

Prepared only by **THE TILDEN CO.**

ESTABLISHED 1848
INCORPORATED 1893

New Lebanon, N. Y.

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

*Medical Letters may be addressed to:*

**Mr. FELLOWS, 48 Vesey Street, New York.**

# MILK OF MAGNESIA.

**A PURE HYDRATED OXIDE OF MAGNESIUM.**—($MgH_2O_2$.)

**ANTACID.**

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach.

---

# PHOSPHO-MURIATE OF QUININE,

**COMPOUND.**

**A RELIABLE ALTERATO-CONSTRUCTIVE.**

Practically applicable to conditions of MAL-NUTRITION.

A reliable TONIC in CONVALESCENCE from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in GLANDULAR ENLARGEMENTS, SCROFULOSIS, IMPERFECT BONE FORMATION, or IMPAIRMENT OF THE CENTRAL NERVOUS SYSTEM. An easily appropriated and stable combination of the Soluble WHEAT PHOSPHATES with MURIATE of QUININE, IRON and STRYCHNIA.

Of greater strength than the various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers.

# PIPERAZIN

## URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent*. This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

**Caution**:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

**"PIPERAZIN (SCHERING)."**

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

**Sole Agents in U. S. LEHN & FINK, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE** from the brain, for diseases of the brain;
**MEDULLINE** from the spinal cord, for diseases of the cord;
**CARDINE** from the heart, for diseases of the heart;
**TESTINE** from the testes, for diseases of the testes;
**OVARINE** from the ovaries, for diseases of the ovaries;
**MUSCULINE** from the muscles, for diseases of the muscles.

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVENUE, NEW YORK.***

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# National Heating AND Ventilating Company

OPERATING

## THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

## THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,
WASHINGTON, D. C.

# BROMIDIA.

Each fld. dr. contains 15 gr. *each* Pure Chloral Hydrat. and Purified Brom. Pot., and ⅛ gr. *each* Cannabis Indica and Hyoscyam. Dose—One-half to one fld. drachm in water or syrup.

# PAPINE.

The Anodyne principle of Opium; the narcotic and convulsive elements being eliminated. Dose—One fld. drachm, represents ⅛ gr. morphia in anodyne principle.

# IODIA.

A combination of active principles of Stillingia, Helonias, Saxifraga, Menispermum and Aromatics. Each fld. dr. contains 5 grs. Iod. Potas. and 3 grs. Phos. Iron. Dose—One or two fld. drachms as indicated.

## BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

# "Laboratory Tests"

DO NOT, according to the great Prof. Liebreich, enable any one to form an opinion of the value of a natural mineral water. What the busy physician wants to know is, "Does this or that water **cure** more promptly and radically than any other?"

He has no time to study a long list of scientific disquisitions from obscure chemists. "The **clinic tells the whole story,**" says he.

We have thousands of letters from the most eminent Chemists, Physicians and laymen, but they must **all give way** to the **evidence** which **none can dispute: THE TEST!** We seek it openly and pay all the bills. If **"LONDONDERRY"** is not the **best medicinal water** in the **world** it must yield its proud position. **If it is,** it must stand on its true worth and retain the confidence of the physicians by its good works.

If **Sparkling Londonderry** is not **pure, palatable,** and the water best adapted, by reason of its **anti-lithic** properties, for use at the table by all lovers of American products, it must give way to its foreign rivals.

Again **THE TEST.** We crave it! The Doctor makes it, and the sale of Londonderry grows from Greater to Greatest!

The Doctor is satisfied—the people are delighted—and stockholders rejoice!

## THE JACKSON SANATORIUM

offers exceptional advantages and attractions.

This institution is under the personal care of a permanent staff of regularly educated and experienced physicians.

Location, 1,200 feet above sea level, in a woodland park, overlooking charming upland and valley views of Genesee region. Pure spring water from rocky heights. Clear, dry atmosphere, free from fogs and malaria. Perfect drainage and sewerage systems. Delightful walks and drives.

Elegant (brick and iron) fire-proof main building and twelve cottages, steam heated, and designed to meet every requirement of invalids, or seekers of rest and quiet.

Extensive apartments for treatment arranged for individual privacy. Skilled attendants. All forms of baths, Electricity, Massage, Swedish Movements, etc., scientifically administered.

**Culinary Department under Supervision of Mrs. Emma P. Ewing,** Superintendent of the Chautauqua Cooking School, whose reputation as a teacher of scientific and hygienic cooking is national.

Comfort without care; freedom from taxations of fashionable life and from the excitements and temptations of popular resorts. Especial provision for quiet and rest, also for recreation, amusement, and regular out-door life. Telegraph, telephone, electric bells, safety elevator, open fires, and all modern appliances for comfort and health On direct line of Del. Lack. & West. R. R. between New York City and Buffalo. Only 9 hours from New York.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

# *Bedford Springs*

# *Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

# HYDROLEINE.

(HYDRATED OIL.)

**Produces rapid increase in Flesh and Strength.**

| FORMULA.—Each Dose contains: | | | |
|---|---|---|---|
| Pure Cod Liver Oil.....30 m. (drops) | Soda.....1-3 Grains. | Recommended and Prescribed by EMINENT PHYSICIANS Everywhere. It is pleasant to the Taste and acceptable to the most delicate Stomach. |
| Distilled Water.....35 " | Salicylic Acid.....1-4 " | |
| Soluble Pancreatin..... 5 Grains. | | |

IT IS ECONOMICAL IN USE AND CERTAIN IN RESULTS.

**HYDROLEINE (Hydrated Oil)** is not a simple alkaline emulsion of oleum morrhuæ, but a hydro-pancreated preparation, containing acids and a small percentage of soda. Pancreatin is the digestive principle of fatty foods, and in the soluble form here used, readily converts the oleaginous material into assimilable matter, a change so necessary to the reparative process in all wasting diseases.

The following are some of the diseases in which **HYDROLEINE** is indicated:

**Phthisis, Tuberculosis, Catarrh, Cough, Scrofula, Chlorosis, General Debility, etc.**

**TO BRAIN WORKERS** of all classes, **HYDROLEINE** is invaluable, supplying as it does, the true brain-food, and being more easily assimilated by the digestive organs than any other emulsion.

The principles upon which this discovery is based have been described in a treatise on "The Digestion and Assimilation of Fats in the Human Body," and "Consumption and Wasting Diseases," by two distinguished London physicians, which will be sent free on application.

*SOLD BY DRUGGISTS GENERALLY.*

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

**N. B.**—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

## THE JEFFERSON MEDICAL COLLEGE
### OF PHILADELPHIA.

**The Annual Session of the Jefferson Medical College begins October 2d, and continues over seven months. Preliminary Lectures will be held from 25th of September.**

### COURSE OF INSTRUCTION AND FACILITIES.

Three years of graded instruction are required of candidates presenting themselves for the degree of M. D., but the voluntary fourth-year course which is now offered is strongly recommended. The instruction consists in didactic lectures, amply supplemented by clinical teaching at the bedside and in the laboratories and dispensaries.

In addition to the members of the Faculty there is a large corps of experienced instructors who assist the professors in practical work in the laboratories or in bedside work at the hospitals and dispensaries. Every student is personally taught, by dividing the class into small sections.

Daily instruction in the practical branches is given in the Hospital of the College, is a special feature of the course in the second and third years, and is without extra charge.

The Annual Announcement, giving full particulars, will be sent on application to

**J. W. HOLLAND, M. D., Dean.**

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

Lysol
TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on LYSOL, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVENUE, NEW YORK.***

# 12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

# Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation."**

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

# FORMALIN

**THE NEW HARMLESS GERMICIDE**

Has a germicidal action superior to Corrosive Sublimate without its toxicity.

**THIS LIQUID MIXES IN ALL PROPORTIONS WITH WATER**

At ordinary temperature even, FORMALIN gives off Gaseous, Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. Stahl, Berlioz, and Frillat, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. Stahl's observations that after one hour's exposure to one per mille, or a quarter of an hour's exposure to $1\frac{1}{3}$ per mille solution of FORMALIN, the most resistant forms of micro-organisms were destroyed. FORMALIN, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

FORMALIN may be applied in 1 per cent. solutions, by spray diffusers, without damage to furniture, metal or materials.

FORMALIN is supplied in one pound bottles.

# DÉVIATION DES RÈGLES.

ALETRIS CORDIAL (Rio) is, perhaps, the most important remedial agent yet known. It is *the* remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc,, all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use

## IS THE DRAGGING SENSATION

in the lower bowels. It quickly restores the strength and waning vitality of the chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

# SOLUBLE
# ELASTIC CAPSULES.

These Capsules are prepared from the finest French Gelatin by improved processes and apparatus, and are very soluble and easy to swallow.

In them physicians have a superior means for the administration of drugs possessing pungent, acrid or oily properties. They are made in the following sizes: 15 grammes, 10 grammes, 5 grammes, 2½ grammes, 10 minims.

Among the many methods of administering medicaments the Soluble Elastic Capsule is growing to be one of the most favored. Among those which are very much sought after are the following:

Cascara Sagrada Extract, 1, 2 and 3 grains.

Quinine Sulphate, 1 to 5 grains.

Quinine Muriate, 2 to 3 grains.

Male-Fern and Kamala. [Formula.—Oleo-Resin Male-Fern, 7 minims; Kamala, sifted, 4 grains.]

Pichi Extract, 5 grains.

Warburg's Tincture. [Each capsule represents two drachms of Warburg's Tincture in a concentrated form.]

Liquor Sedans, a utero-ovarian sedative and anodyne. [Formula.—Each fluidounce represents: Black Haw, 60 grains; Golden Seal, 60 grains, containing its chief alkaloidal constituents; Jamaica Dogwood, 30 grains; combined with aromatics.]

Santonin and Castor Oil. [Santonin, $\frac{1}{40}$ grain; Castor Oil, 40 minims.]

*Send for complete descriptive catalogue of our Soluble Elastic Capsules giving formulæ for all contained in the list.*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles,** by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

# *Bedford Springs Mineral Water*

## NATURE'S REMEDY

For diseases of the Liver, Stomach and Kidneys

## The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1893.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

# EUROPHEN

SUBSTITUTE FOR IODOFORM.

AS an antiseptic dressing and cicatrisant in minor and general surgery, and as an eligible application for ulcerative or catarrhal conditions of the membranous tissues, Europhen, or isobutylorthocresoliodide, heads the list of topical remedies. In lesions of a specific character, whether of recent origin or of long standing, Europhen gives prompt and gratifying results. For chronic ulcers of the leg, fistulæ and burns, Europhen is an unrivalled application; and it may be advantageously employed in all cavital troubles ordinarily treated by iodoform, or the antiseptics. Europhen has an agreeable odor; it covers five times more surface than iodoform; and it adheres firmly to lesions to which it is applied. Supplied in ounces.

# NOTE THE FOLLOWING.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.

## UNIVERSITY OF PENNSYLVANIA.

### MEDICAL DEPARTMENT.

THE 128TH ANNUAL WINTER SESSION will begin Monday, Oct. 2d, 1893, at 12 M., and will end at Commencement, June 5th, 1894
THE PRELIMINARY AND SPRING SESSIONS have been discontinued.

The curriculum is graded and attendance upon four annual winter sessions is required. College GRADUATES in Arts or Science, who have pursued certain Biological studies, are admitted to advanced standing. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology, with Bedside Instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and Gen'l Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITÉRAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat Sc.D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D, Professor of Hygiene.

For Catalogue and announcement containing particulars apply to

DR. JOHN MARSHALL, Dean,
36th St. and Woodland Avenue, Philadelphia.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY is a DISEASE and CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,
Sup't Walnut Lodge, Hartford, Conn.

## TERRACE BANK SANITORIUM

Dr. R. S. Sutton's Private Institution for the Treatment of Surgical Diseases of Women.

PERFECT SANITARY AND ASEPTIC ARRANGEMENTS, and provided with all Modern Conveniences, Address

170 RIDGE AVENUE, ALLEGHENY, PA.

## University of Maryland,

### FACULTY OF PHYSIC,

BALTIMORE, MD.

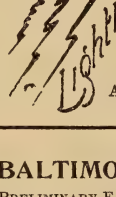
The Eighty-Seventh Annual Session commences October 2d, 1893, and ends in April, 1894. Large amount of clinical material, and ample facilities for work in chemical and histological laboratories and in the dissecting room. Each graduate has personal experience in obstetrics.

For Catalogue and other information, address

**Dr. J. EDWIN MICHAEL,**
**201 W. Franklin St., Baltimore.**

### DENTAL DEPARTMENT.

Session begins October 2d, 1893. For Catalogue, address
DR. F. J. S. GORGAS, Dean,
845 N. Eutaw Street, Baltimore.



## DESTROYS!

**Shall it be Your House or a Pound of Copper?**

Entirely new departure in protecting buildings from lightning.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address
DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

# PIPERAZIN

## URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

**Caution:**—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

**"PIPERAZIN (SCHERING)."**

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

**Sole Agents in U. S. LEHN & FINK, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE** from the brain, for diseases of the brain;
**MEDULLINE** from the spinal cord, for diseases of the cord;
**CARDINE** from the heart, for diseases of the heart;
**TESTINE** from the testes, for diseases of the testes;
**OVARINE** from the ovaries, for diseases of the ovaries;
**MUSCULINE** from the muscles, for diseases of the muscles.

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVENUE, NEW YORK.***

# An Antipyretic that does not depress the heart

Hence especially useful in

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# DYSPEPSIA.

Deranged digestion is the most common of all human ailments. It is a truism that no organ of the body can preserve its normal integrity **when** its supplying nerve is disordered **by lowered tone.** But this fact is largely ignored in these modern pepsin days—the **cause** being lost sight of whilst trying to remedy the effect. It is well known that any unusual worry or anxiety will upset the digestion of **the neurotic** patient. Hence, in treating dyspepsia, particularly atonic dyspepsia, that form met with in persons of low vitality and poor appetite, there are **two distinct INDICATIONS.** One is to subserve the needs of general nutrition, the other is to subserve the needs of the nervous system. This can be done by giving the patient good nutritious food and a good nerve tonic. This explains why such remarkable results follow the daily use of **CELERINA** in all dyspeptic troubles.

# Phytoline

## A POWERFUL ANTI-FAT.

Phytoline is now recognized by the Medical Profession as being the only remedy in the Treatment of Obesity that will absorbe the fatty tissue in a great degree without any evil after-effects whatsoever.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF THE PHYTOLACCA DECANDRA.

A VALUABLE PRESCRIPTION FOR OBESITY AND FATTY DEGENERATION OF THE HEART.

℞ Phytoline (Walker's)
Sig.— Take ten drops in water before and after the three daily meals, as directed
Dr

GRANULAR EFFERVESCENT

**BROMO LITHIA**

(WARNER & CO.)

Each dessertspoonful contains

℞ Salicylate Lithia, 10 grs.,
and Bromide Soda, 10 grs.

A remedy in the treatment of

**RHEUMATISM, GOUTY DIATHESIS, ETC.**

Dr. A. Garrod, the well-known English authority on Gout, who was the first physician to introduce the Lithia Salts in the treatment of the gouty diathesis, states that their action is materially increased by being administered in a *freely diluted form*

This effervescing salt of Lithia furnish an easy and elegant way of applying Dr. Garrod's methods.

PREPARED ONLY BY

**WM. R. WARNER & CO.**

For Nervous Headache and Brain Fatigue.

WARNER & CO.'S EFFERVESCING

**BROMO SODA**

(WARNER & CO.)

**Useful in Nervous Headache, Sleeplessness, Excessive Study, Over Brainwork, Nervous Debility, Mania, etc., etc.**

DOSE.—A heaping teaspoonful in half a glass of water.

It is claimed by some prominent specialists in nervous diseases that the Sodium Salt is more acceptable to the stomach than the Bromide Potassium. An almost certain relief is given by the administration of this Effervescing Salt. It is also used with advantage in INDIGESTION, DEPRESSION following alcoholic and other excesses, as well as NERVOUS HEADACHE. It affords speedy relief for MENTAL and PHYSICAL EXHAUSTION.

PREPARED ONLY BY

**WM. R. WARNER & CO.**

**Mellin's Food**

**For Infants and Invalids.**

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# "Laboatrory Tests"

DO NOT, according to the great Prof. Liebreich, enable any one to form an opinion of the value of a natural mineral water. What the busy physician wants to know is, "Does this or that water **cure** more promptly and radically than any other?"

He has no time to study a long list of scientific disquisitions from obscure chemists. "The **clinic tells the whole story,"** says he.

We have thousands of letters from the most eminent Chemists, Physicians and laymen, but they must **all give way** to the **evidence** which **none can dispute: THE TEST!** We seek it openly and pay all the bills. If **"LONDONDERRY"** is not the **best medicinal water** in the **world** it must yield its proud position. **If it is,** it must stand on its true worth and retain the confidence of the physicians by its good works.

If **Sparkling Londonderry** is not **pure, palatable,** and the water best adapted, by reason of its **anti-lithic** properties, for use at the table by all lovers of American products, it must give way to its foreign rivals.

Again **THE TEST.** We crave it! The Doctor makes it, and the sale of Londonderry grows from Greater to Greatest!

The Doctor is satisfied—the people are delighted—and stockholders rejoice!

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

## MEDICAL DEPARTMENT OF THE COLUMBIAN UNIVERSITY.

WASHINGTON, D. C.

### ANNOUNCEMENT, 1893—'94.

The Seventy-second Session will begin October 1st, 1893, and continue seven months. Graded four year course required. Ample clinical facilities.

FACULTY:

J. F. THOMPSON, Surgery.
W. W. JOHNSTON, Practice.
A. F. A. KING, Obstetrics.
E. A. DE SCHWEINITZ, Chemistry.
WM. P. CARR, Physiology.
D. W. PRENTISS, Therapeutics.
D. K. SHUTE, Anatomy.
H. C. YARROW, Dermatology.
G. B. HARRISON, Pediatrics.
THEO. SMITH, Bacteriology and Hygiene.
T. E. McARDLE, Minor Surgery.
H. L. E. JOHNSON, Gynæcology.
G. N. ACKER, Pathological Histology.
W. M. GRAY, Normal Histology.
W. K. BUTLER, Ophthalmology.
S. RUFFIN, Medical Jurisprudence.
C. W. RICHARDSON, Laryngology and Otology.
A. C. PATTERSON, Mental Diseases.
E. L. TOMPKINS, Neurology.

For circulars, address **A. F. A. KING, M. D., Dean,**
1315 Massachussets Avenue, N. W., Washington, D. C.

## THE JEFFERSON MEDICAL COLLEGE
## OF PHILADELPHIA.

**The Annual Session of the Jefferson Medical College begins October 2d, and continues over seven months. Preliminary Lectures will be held from 25th of September.**

### COURSE OF INSTRUCTION AND FACILITIES.

Three years of graded instruction are required of candidates presenting themselves for the degree of M. D., but the voluntary fourth-year course which is now offered is strongly recommended. The instruction consists in didactic lectures, amply supplemented by clinical teaching at the bedside and in the laboratories and dispensaries.

In addition to the members of the Faculty there is a large corps of experienced instructors who assist the professors in practical work in the laboratories or in bedside work at the hospitals and dispensaries. Every student is personally taught, by dividing the class into small sections.

Daily instruction in the practical branches is given in the Hospital of the College, is a special feature of the course in the second and third years, and is without extra charge.

The Annual Announcement, giving full particulars, will be sent on application to

**J. W. HOLLAND, M. D., Dean.**

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## University of Maryland,

### FACULTY OF PHYSIC,

**BALTIMORE, MD.**

The Eighty-Seventh Annual Session commences October 2d, 1893, and ends in April, 1894. Large amount of clinical material, and ample facilities for work in chemical and histological laboratories and in the dissecting room. Each graduate has personal experience in obstetrics.

For Catalogue and other information, address

**Dr. J. EDWIN MICHAEL,**
**201 W. Franklin St., Baltimore.**

### DENTAL DEPARTMENT.

Session begins October 2d, 1893. For Catalogue, address
DR. F. J. S. GORGAS, Dean,
845 N. Eutaw Street, Baltimore.

## THE BALTIMORE MEDICAL COLLEGE.

PRELIMINARY FALL COURSE begins September 1st; REGULAR WINTER COURSE begins October 1st.

EXCELLENT TEACHING FACILITIES: Magnificent New College Building; Superb Lecture Halls; large and completely equipped Laboratories; capacious Hospital and Dispensary; Lying-in-Department for teaching Clinical Obstetrics; Large Clinics.

Send for Catalogue, and address
DAVID STREETT, M. D., Dean,
403 N. Exeter St., Baltimore, Md.

## WALNUT LODGE HOSPITAL
### HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
**ALCOHOL AND OPIUM INEBRIATES.**

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE AND CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,

# SALIPYRIN=RIEDEL

**ANALGESIC**
**ANTIPYRETIC**
**ANTI=RHEUMATIC**

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to Lysol, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# An "Ideal Disinfectant" and Antiseptic.

Lysol

Lysol
TRADE MARK.

**Put up in One Pound Bottles.**
(1 pound furnishes 12 gallons of a 1% solution.)

A full descriptive pamphlet, containing interesting monograph, clinical reports and extracts on Lysol, sent to physicians free on request.

**LEHN & FINK, Sole Agents, NEW YORK.**

# The Animal Extracts

perfectly sterilized—prepared according to Dr. William A. Hammond's formulæ, in his laboratory at Washington, D. C., and under his immediate supervision, can now be obtained directly of The Columbia Chemical Company, 90 South Fifth Avenue, New York, or through any druggist, at the price of $2.00 a bottle.

The extracts at present manufactured are:

**CEREBRINE from the brain, for diseases of the brain;**
**MEDULLINE from the spinal cord, for diseases of the cord;**
**CARDINE from the heart, for diseases of the heart;**
**TESTINE from the testes, for diseases of the testes;**
**OVARINE from the ovaries, for diseases of the ovaries;**
**MUSCULINE from the muscles, for diseases of the muscles.**

Others are in process of preparation, and when ready the fact will be duly announced to the profession.

Several months are required for the extraction of the essential principle of the organs. Extracts purporting to be made in a few days are absolutely inert, and, from their liability to decomposition, are dangerous.

All the existing literature on the subject of the Animal Extracts

**Made by Dr. Hammond's Process**

and used in accordance with his theory of their action, will be supplied to members of the medical profession GRATIS on application to

***THE COLUMBIA CHEMICAL CO., 90 SOUTH FIFTH AVENUE, NEW YORK.***

# 12 Indications For the use of Wine of Coca

1. Weak conditions of the generative system
2. Sick headache, neuralgia, nervous dyspepsia
3. Opium, alcohol, tobacco or chloral habit
4. To increase the power of the mind
5. To strengthen those past middle life
6. Neurasthenia, and irritable nervous system
7. Exhaustive conditions of the nervous system
8. Depression of spirits, melancholia, hysteria
9. Muscular weakness and general debility
10. As a tonic to the voice, invaluable to speakers
11. In convalescence from exhausting diseases
12. Loss of appetite, and gastro-intestinal catarrh

# Why Prescribe RESTORATIVE Wine of Coca

"The proportion of Alkaloid is invariable—two grains to the pint. It can therefore be prescribed with the certainty of obtaining uniform results—the active principle of the Coca leaves contained in the Wines of Coca on the market vary from nothing to ¾ of a grain. **Restorative Wine of Coca is a standard preparation."**

It is absolutely free from all those foreign substances present in all other Wines of Coca and which interfere with their curative influence. We will send a bottle free.

**THE COLUMBIA CHEMICAL CO.,**

**90 South Fifth Avenue, New York.**

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :

This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :

The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

## SCHERING & GLATZ,

**Sole Representatives in the United States for Chemische Fabrik auf Actien, vorm. E. Schering, BERLIN, Germany.**

**55 MAIDEN LANE, NEW YORK.**

**PAMPHLETS FURNISHED ON APPLICATION.**

# EVERY PHYSICIAN

has a certain class of patients who worry him a good deal, for while not being exactly ill or confined to their beds, they are always complaining of a feeling of depression, loss of energy, restlessness, insomnia and a general feeling of "je ne sais quoi;" and while these symptoms may indicate a certain form of neurosis or nervous debility, he is at a loss as to what to prescribe, for while there are numerous remedies for nervous diseases, he is often puzzled as to which to use. It is in this class of cases that CELERINA, a combination of Celery, Coca, Kola and Viburnum, is indicated, for while not acting as an unnatural stimulus, it soon restores the tired and jaded nervous system to its normal condition, and brings about a feeling of buoyancy and energy that will be pleasing and surprising to both physician and patient, and will induce him to confirm the verdict of his brethren all over the world as to the virtues of this preparation. It is put up in elegant and palatable form, and being made of the best material in large quantities, it is always uniform and certain in its results.

*A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.*

# "Laboratory Tests"

DO NOT, according to the great Prof. Liebreich, enable any one to form an opinion of the value of a natural mineral water. What the busy physician wants to know is, "Does this or that water **cure** more promptly and radically than any other?"

He has no time to study a long list of scientific disquisitions from obscure chemists. "The **clinic tells the whole story,**" says he.

We have thousands of letters from the most eminent Chemists, Physicians and laymen, but they must **all give way** to the **evidence** which **none can dispute: THE TEST!** We seek it openly and pay all the bills. If **"LONDONDERRY"** is not the **best medicinal water** in the **world** it must yield its proud position. **If it is,** it must stand on its true worth and retain the confidence of the physicians by its good works.

If **Sparkling Londonderry** is not **pure, palatable,** and the water best adapted, by reason of its **anti-lithic** properties, for use at the table by all lovers of American products, it must give way to its foreign rivals.

Again **THE TEST.** We crave it! The Doctor makes it, and the sale of Londonderry grows from Greater to Greatest!

The Doctor is satisfied—the people are delighted—and stockholders rejoice!

# AN APOLOGY.

In the *New York Medical Journal*, January 28th, 1893, appeared an article by William A. Hammond, entitled: "On Certain Organic Extracts, their Preparation, and Physiological and Therapeutical Effects."

While the record of this author is not one calculated to inspire respect for any opinions that might be advanced by him, yet we were led to accept fully his statements and deductions because of *quasi*-indorsement by the editor of the above-named *Journal*.

Being actuated by a desire to keep abreast of the times, and without any thought or intent of injustice to anyone, we began experimentation regarding the production of so-called "Cerebrine," and other animal extracts, referred to in the foregoing paper. As a result, we were speedily convinced that their manufacture could be completed, without any detriment to the substances themselves, in a much less period of time than that claimed by Dr. Hammond; and, consequently, later we announced our ability to supply "Cerebrin."

Soon after, we were surprised to receive a letter from Dr. Hammond claiming sole proprietorship of the word "Cerebrine" which, too, had been duly trade-marked, and announcing that "The Columbia Chemical Co. are alone authorized by me to handle the extracts made by my processes, and that all are made in my own laboratory, under my own supervision."

Other papers laudatory of "Animal Extracts," and presenting the same general claims, appeared in many other medical journals besides numerous lay publications—thereby demonstrating the fact that the first-named article was written and published (as evidenced by Dr. Hammond's own statements) for the sole benefit of the Columbia Chemical Co., of which he (Dr. Hammond) is President and a large shareholder.

Subsequently Dr. Hammond widely disseminated through the mails and by publication in the *New England Medical Monthly* (Dr. Wile) a circular over his own signature, not only attacking us unjustly, but in a manner most scurrilous and unbecoming to an officer, a professional man or a gentleman. He also threatened us, through his attorneys in New York, with dire penalties if we did not cease the sale of the articles.

The development of the fact that the paper in the *New York Medical Journal* was written and published for *mercenary* purposes led us to doubt the statements of the author of the article, and incidentally we were induced to have the value of "Cerebrine" as manufactured by Hammond, and "Cerebrin" as made by ourselves, therapeutically and physiologically tested. As a result, we are now convinced that both "Cerebrine" (Hammond) and "Cerebrin" (P. D. & Co.) will not respond to Dr. Hammond's claims.

We, therefore, announce, that while we are prepared and willing to supply "Cerebrin," as manufactured by us after our formula, in response to all demands, that we have grave doubts as to the merits of the article, and, therefore, present our apology to the medical profession for the error into which we were unwittingly led by the *New York Medical Journal*.

We invite correspondence upon this subject, and are prepared to supply interesting information in printed form to all who will apply for the same.

PARKE, DAVIS & CO.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

ASTHMA and

PULMONARY TUBERCULOSIS

DOSE: One or Two Teaspoonfuls before meals, or oftener, regulated by age or disease
FORMULÆ: Each fluid drachm contains Phosphorus 1-100 of a grain; Iodine, 1-6 of a grain; Bromine, 1-6 grain.

Prepared only by THE TILDEN CO.

ESTABLISHED 1848
INCORPORATED 1893

New Lebanon, N. Y.

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

*Medical Letters may be addressed to:*

# MILK OF MAGNESIA.

**A PURE HYDRATED OXIDE OF MAGNESIUM.**—($MgH_2O_2$.)

**ANTACID.**

Practically Magnesia in permanent solution—not mechanically suspended—Miscible with other fluids—A mild and pleasant laxative—Free from carbonic acid, and in a form easy of administration and absorption. No danger from concretions as with the calcined. It combines well with Syr. Rhubarb, Soda, Opium, the vegetable astringents, &c., and will be found superior to bulky Lime water and Chalk mixtures for addition to milk.

Especially applicable to disturbances of the gastro-intestinal tract in infant, child and adult life. Neutralizes the acrid secretions of diseased mucous surfaces. Indicated also in the Gouty and Rheumatic diathesis in combination with Salicylate of Soda, rendering the latter more efficient and less irritating to the stomach.

---

# PHOSPHO-MURIATE OF QUININE,

**COMPOUND.**

**A RELIABLE ALTERATO-CONSTRUCTIVE.**

Practically applicable to conditions of MAL-NUTRITION.

A reliable TONIC in CONVALESCENCE from the exanthemata, and of obvious indication in those cases whose deficiency of the Phosphates results in GLANDULAR ENLARGEMENTS, SCROFULOSIS, IMPERFECT BONE FORMATION, or IMPAIRMENT OF THE CENTRAL NERVOUS SYSTEM. An easily appropriated and stable combination of the Soluble WHEAT PHOSPHATES with MURIATE of QUININE, IRON and STRYCHNIA.

Of greater strength than the various Hypophosphite compounds.

The above Preparations are put up in Dispensing and Trade Containers.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00
Per case of One Dozen Bottles, - 12.00.

## UNIVERSITY OF PENNSYLVANIA.

### MEDICAL DEPARTMENT.

THE 128TH ANNUAL WINTER SESSION will begin Monday, Oct. 2d, 1893, at 12 M., and will end at Commencement, June 5th, 1894
THE PRELIMINARY AND SPRING SESSIONS have been discontinued.

The curriculum is graded and attendance upon four annual winter sessions is required. College GRADUATES in Arts or Science, who have pursued certain Biological studies, are admitted to advanced standing. Practical instruction, including laboratory work in Chemistry, Histology, Osteology and Pathology, with Bedside Instruction in Medicine, Surgery, Gynæcology and Obstetrics, are a part of the regular course and without additional expense.

FACULTY:

WILLIAM PEPPER, M.D., LL.D., Professor of Theory and Practice of Medicine and of Clinical Medicine.
WILLIAM GOODELL, M.D., Professor of Gynæcology.
JAMES TYSON, M.D., Professor of Clinical Medicine.
HORATIO C. WOOD, M.D., LL.D., Professor of Materia Medica, Pharmacy and Gen'l Therapeutics.
THEODORE G. WORMLEY, M.D., LL.D., Professor of Chemistry and Toxicology.
JOHN ASHHURST, JR., M.D., Professor of Surgery and Clinical Surgery.
EDWARD T. REICHERT, M.D., Professor of Physiology.
WILLIAM F. NORRIS, M.D., Professor of Ophthalmology.
BARTON COOKE HIRST, M.D., Professor of Obstetrics.
J. WILLIAM WHITE, M.D., Professor of Clinical Surgery.
JOHN GUITÉRAS, M.D., Professor of General Pathology and Morbid Anatomy.
GEORGE A. PIERSOL, M.D., Professor of Anatomy.
JOHN MARSHALL, M.D., Nat Sc.D., Assistant Professor of Chemistry.
LOUIS A. DUHRING, M.D., Professor of Diseases of the Skin.
JOHN S. BILLINGS, M.D., LL.D, Professor of Hygiene.

For Catalogue and announcement containing particulars apply to

DR. JOHN MARSHALL, Dean,

403 N. Exeter St., Baltimore, Md.

# PIPERAZIN

**URIC ACID SOLVENT.**

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent*. This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

**Caution**:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

**"PIPERAZIN (SCHERING)."**

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

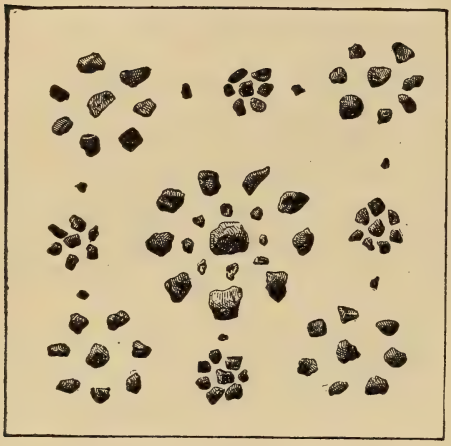

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# CELERINA.

**W. P. England, M. D., White Pine, Pa.,** says: I have used Celerina and am pleased to say that in all cases of nervous prostration, such as follows the use of alcohol, and for all cases of nervous debility, I find it without an equal. After the experience I have had with it I do not hesitate in recommending it to the profession as one of our best nerve tonics.

**The action of Celerina on the brain and nervous system is that of an exhilarant and slight narcotic, relieving depressions and lessens irritable nerve conditions. In cases of organic and functional lesions of the heart, an increased steadiness of pulse-beat and diminution of pulse irritation is apparent.**

**A. J. Wesco, M. D., Seven Mile, O.,** says: I have tested Celerina and got good results. Man, aged sixty-five years, mechanic, habits very intemperate, will spree for weeks, came to me with nervous system in bad fix; could not eat or sleep. Gave him eight ounces Celerina, teaspoonful three times a day, which placed him on his feet again, and for that I think it par excellence.

**Convulsions may frequently be cut short, like magic, by teaspoonful doses of Celerina repeated at short intervals. The nausea as an after-effect of chloroform or other narcosis, may generally be controlled in the same manner.**

**T. J. Haile, M. D., Atlanta, Ga.,** says: Celerina has always acted finely in all cases where I have tried it, especially in those troublesome cases of hysteria, nervous depression and feebleness, and prostration resulting from alcoholic excess. Have found its effects very exhilarating and nourishing. In fact, it is my main dependence in all nervous diseases.

**The psychological depressions and neuralgias, so common in the period following a debauch, are lessened or disappear altogether by the use of Celerina.**

**J. B. Johnson, M. D., 920 N St., Washington, D. C.,** says: I used Celerina not only as a nervine and tonic, but also found it most excellent, in two drachm doses, in sobering persons who were made drunk by alcoholic drink, and such patients informed me that they were greatly assisted in recovering from a spree by the use of Celerina.

**After the removal of alcohol, Celerina, given in doses of from one-half to one ounce every four hours, is speedily followed by the most characteristic symptoms of improvement.**

**Dr. Bramwell, Whitley, Northumberland, England,** says: I have found Celerina valuable as a nerve stimulant and restorative in a patient suffering from the effects of a severe drinking bout.

## RIO CHEMICAL CO.,

A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

# GASTRIC DERANGEMENTS.

## HORSFORD'S ACID PHOSPHATE.

Unlike all other forms of phosphorus in combination, such as dilute phosphoric acid, glacial phosphoric acid, neutral phosphate of lime, hypophosphites, etc., the phosphates in this product are in solution, and readily assimilated by the system, and it not only causes no trouble with the digestive organs, but promotes in a marked degree their healthful action.

In certain forms of dyspepsia it acts as a specific.

**Dr. T. G. COMSTOCK**, of the Good Samaritan Hospital, St. Louis, says: "For some years we have used it in a variety of derangements characterized by debility, as also in chronic gastric ailments. It is approved of, unanimously, by the medical staff of this Hospital."

Send for descriptive circular. Physicians who wish to test it will be furnished a bottle on application, without expense, except express charges.

Prepared under the direction of Prof. E. N. HORSFORD, by the

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

# "Laboratory Tests"

DO NOT, according to the great Prof. Liebreich, enable any one to form an opinion of the value of a natural mineral water. What the busy physician wants to know is, "Does this or that water **cure** more promptly and radically than any other?"

He has no time to study a long list of scientific disquisitions from obscure chemists. "The **clinic tells the whole story,**" says he.

We have thousands of letters from the most eminent Chemists, Physicians and laymen, but they must **all give way** to the **evidence** which **none can dispute: THE TEST!** We seek it openly and pay all the bills. If **"LONDONDERRY"** is not the **best medicinal water** in the **world** it must yield its proud position. **If it is,** it must stand on its true worth and retain the confidence of the physicians by its good works.

If **Sparkling Londonderry** is not **pure, palatable,** and the water best adapted, by reason of its **anti-lithic** properties, for use at the table by all lovers of American products, it must give way to its foreign rivals.

Again **THE TEST.** We crave it! The Doctor makes it, and the sale of Londonderry grows from Greater to Greatest!

The Doctor is satisfied—the people are delighted—and stockholders rejoice!

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles**, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails. A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.

It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc. THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

MAIL US YOUR Name and Address and we will send book of TESTIMONIALS.

# TREATMENT OF TUBERCULOSIS.

The history of modern therapeutics shows a tendency among medical men to oscillate between extremes, like the pendulum, until finally the mean, or practical "point of rest" is reached.

This tendency is particularly noticeable in the treatment of the tubercular diseases. On the one hand we have had the "Gavage" or over-eating system, in which the patient is compelled to endure passive stuffing and absolute rest, in order to combat the so-called "waste of tissue" of the disease.

The fallacy of that theory having been demonstrated by its continued failure in actual practice, we seem to have swung to the opposite extreme of considering the patient as an indifferent receptacle of disease germs, into which it is sufficient to simply inject the appropriate germicide to effect a cure. So we have the various lymphs, antiseptic fluids, and other purely germicidal methods of treatment. But the results are showing that the *patient* refuses to be ignored as a factor in the case. The dead germs and the dead patient are buried together.

We see that the principle is as sound in medicine as it is in philanthropy, that the true help is that which enables the person to help himself. This is the principle upon which the treatment with the hypophosphites of lime and soda is based.

Each individual patient is composed of a collection of cells possessing vital powers. In tuberculosis these vital powers of the cells, and hence of the patient, are weakened. But by administering this remedy judiciously we gradually restore the cells again to their normal condition, enabling them to battle successfully with the invading bacilli, and to repair gradually the damage done to the tissue structures. Thus the organism requires additional strength with each step in advance, and the cure is finally complete.

Many, no doubt, have at some time in their experience touched upon the hypophosphites. They have given them in oil, in malt extract, in some acid mixture, or in a compound with a half a dozen "tonics" added to it, and have been disappointed. The illustrious founder of this successful mode of treatment, Dr. Churchill, did not recommend any such heterogeneous mixtures of foreign substances, and his remedy should not be held responsible for the consequent failures. He simply urged that the chemically pure hypophosphites of lime and soda should be administered with judgment, perseveringly, until a permanent cure resulted. Pharmacists, ambitious of getting up rival preparations, have made the attempted improvements. It is needless to say that wherever these innovations have been adopted, failure has resulted, and the entire treatment has been brought into disrepute and abandoned.

With the pure hypophosphites of lime and soda you can score success time and again. The results are gradual, steady and certain if the remedy is persevered with faithfully, until the cure is complete. None but chemicals of known genuineness and absolute purity should be used. McArthur's Syrup is prepared on the principle laid down by Dr. Churchill. It contains the chemically pure hypophosphites of lime and soda, uncomplicated with other drugs, in a pure and wholesome syrup. If you would like to study this subject more closely the McArthur Hypophosphite Co., Boston, Mass., will send you, free, a pamphlet on "The Treatment and Curability of Consumption."

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

## THE JEFFERSON MEDICAL COLLEGE
### OF PHILADELPHIA.

**The Annual Session of the Jefferson Medical College begins October 2d, and continues over seven months. Preliminary Lectures will be held from 25th of September.**

### COURSE OF INSTRUCTION AND FACILITIES.

Three years of graded instruction are required of candidates presenting themselves for the degree of M. D., but the voluntary fourth-year course which is now offered is strongly recommended. The instruction consists in didactic lectures, amply supplemented by clinical teaching at the bedside and in the laboratories and dispensaries.

In addition to the members of the Faculty there is a large corps of experienced instructors who assist the professors in practical work in the laboratories or in bedside work at the hospitals and dispensaries. Every student is personally taught, by dividing the class into small sections.

Daily instruction in the practical branches is given in the Hospital of the College, is a special feature of the course in the second and third years, and is without extra charge.

The Annual Announcement, giving full particulars, will be sent on application to

**J. W. HOLLAND, M. D., Dean.**

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{15}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY

NEW YORK.

**Horace Tracy Hanks**, M. D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N. Y. Journ. Gyn. & Obstetrics.*

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :
This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1½ per mille solution of **FORMALIN**, the most resistant forms of microorganisms were destroyed. **FORMALIN**, therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

# Uterine Diseases.

I am much pleased with ALETRIS CORDIAL as a remedy in uterine diseases. I have been in constant practice for more than half a century, and have used the aletris farinosa most of the time. When I learned the composition of the ALETRIS CORDIAL (Rio Chem. Co.) I inferred at once that it would prove a very good uterine tonic, and find it is just the thing. Following is a case in which I used ALETRIS CORDIAL: Mrs. C., aged 33 years, has been suffering since confinement, some two years since, with leucorrhea, more or less most of the time and frequently quite profuse. I have treated her with ordinary remedies, such as tonics internally and astringent injections, with variable results, but never entirely relieving the leucorrhea. Her general health suffered less than common in such persistent cases. Some time since I made a more critical examination, and found preternatural redness of whole vaginal cavity from labia to uterus; the cervix uteri and the os tumified and sensitive to touch, as also the abdomen, especially over the ovaries; cold feet, hot head, debility and nervous exhaustion, odorous urine, itching of the vulva, etc. I used S. H. KENNEDY'S EXTRACT OF PINUS CANADENSIS as an injection and put the patient on ALETRIS CORDIAL. By the time the first bottle was used, the disease was about cured. The leucorrheal discharge ceased and the redness, etc., much diminished. I attribute her speedy relief to the ALETRIS CORDIAL, for all other applications had been persistently tested with but little benefit. I expected the ALETRIS CORDIAL to tone up the weakened womb, but supposed something more specific would be requisite to subdue the irritation and subacute inflammation of the vagina. JOS. S. BURR, M.D., Leesville, O.

---

I had under my treatment a lady, Mrs. H., 36 years of age, married twelve years, no children, who had suffered for twenty years with painful and irregular menstruation, followed by leucorrhea and nervous hysteria at times. She had tried all kinds of drugs, but not receiving any benefit from them, consulted a number of physicians, but also without effect. The 14th of April last she became one of my patients, and I prescribed the usual formulas which were carefully prepared at my own dispensary, but to her and my regret only gained momentary benefit. I concluded to make a trial of the following prescription:

R. Celerina ..... 8 ounces.
ALETRIS CORDIAL ..... 8 ounces.
M. Sig.: Two teaspoonfuls half an hour before meals.

For injection I prescribed one part S. H. KENNEDY'S EXTRACT OF PINUS CANADENSIS (White) with nine parts of water, three times a day. The result has been surprising. I wanted the lady to continue the medicines, but Mrs. H. insisted upon not doing it, for she claimed that having regained her youthful health and vigor, she would need no more medicine at present.

C. A. BRUEGMANN, M. D., Marysville, Neb.

# HYGIENIC AGENTS.

Dietetic Waters, more generally called Table Waters, *if pure,* are of great value as hygienic agents, says the N. Y. Medical Journal.

The lay public, however, are apt to confound Table Waters with Medicinal Waters containing active chemical substances which cannot safely be included as part of the ordinary daily diet.

The British Medical Journal says that Apollinaris *reigns alone* among Natural Dietetic Table Waters.

**For Pamphlets,**

# SOLUBLE
# ELASTIC CAPSULES.

These Capsules are prepared from the finest French Gelatin by improved processes and apparatus, and are very soluble and easy to swallow.

In them physicians have a superior means for the administration of drugs possessing pungent, acrid or oily properties. They are made in the following sizes: 15 grammes, 10 grammes, 5 grammes, 2½ grammes, 10 minims.

Among the many methods of administering medicaments the Soluble Elastic Capsule is growing to be one of the most favored. Among those which are very much sought after are the following:

Cascara Sagrada Extract, 1, 2 and 3 grains.

Quinine Sulphate, 1 to 5 grains.

Quinine Muriate, 2 to 3 grains.

Male-Fern and Kamala. [Formula.—Oleo-Resin Male-Fern, 7 minims; Kamala, sifted, 4 grains.]

Pichi Extract, 5 grains.

Warburg's Tincture. [Each capsule represents two drachms of Warburg's Tincture in a concentrated form.]

Liquor Sedans, a utero-ovarian sedative and anodyne. [Formula.—Each fluidounce represents: Black Haw, 60 grains; Golden Seal, 60 grains, containing its chief alkaloidal constituents; Jamaica Dogwood, 30 grains; combined with aromatics.]

Santonin and Castor Oil. [Santonin, $\frac{1}{10}$ grain; Castor Oil, 40 minims.]

*Send for complete descriptive catalogue of our Soluble Elastic Capsules giving formulæ for all contained in the list.*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

# *Mineral Water*

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

## National Heating AND Ventilating Company

OPERATING

## THE TIMBY SYSTEM

OF

Heating, Cooling, Ventilating and Disinfecting.

FOR Cities, Towns, Hotels, Factories, Breweries, Markets, Poor-Houses, Barracks, Colleges, School-Houses, Theatres, Private Dwellings, and, above all, Hospitals,

### THE TIMBY SYSTEM

for Heating, Cooling, Ventilating, Refrigerating, Deodorizing, Fumigating, and Disinfecting, as operated by THE NATIONAL HEATING AND VENTILATING COMPANY, and State and other local companies acting under its license, can not but be regarded as one of the greatest inventions of modern times. The attention of Physicians and Hospital authorities is especially invited to a consideration of its merits. It heats in winter, cools in summer, thoroughly ventilates at all times, and deodorizes, fumigates, and disinfects when required so to do, and all this with much less consumption of fuel than any other system of steam or hot water yet devised for heating only.

State and other local rights for sale on advantageous terms.

The system has been in successful operation for nearly a year, winter and summer, in the Lawrence Building, 615 and 617 Fourteenth Street, Washington, D. C.

Circulars and other additional information can be obtained by addressing either of the undersigned:

A. E. STEVENS,
Secretary.

WM. A. HAMMOND, M. D.,
President.

615, 617 14TH STREET,

WASHINGTON, D. C.

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

Londonderry, N. H., June 5, 1893.

Gentlemen — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

To The Londonderry Lithia Spring Water Co., Nashua, N. H.

---

Note.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—Londonderry Lithia Co.

# EUROPHEN

SUBSTITUTE FOR IODOFORM.

AS an antiseptic dressing and cicatrisant in minor and general surgery, and as an eligible application for ulcerative or catarrhal conditions of the membranous tissues, Europhen, or isobutylorthocresoliodide, heads the list of topical remedies. In lesions of a specific character, whether of recent origin or of long standing, Europhen gives prompt and gratifying results. For chronic ulcers of the leg, fistulæ and burns, Europhen is an unrivalled application; and it may be advantageously employed in all cavital troubles ordinarily treated by iodoform, or the antiseptics. Europhen has an agreeable odor; it covers five times more surface than iodoform; and it adheres firmly to lesions to which it is applied. Supplied in ounces.

# NOTE THE FOLLOWINC.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well-known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

# PIPERAZIN

## URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

**Caution**:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

**"PIPERAZIN (SCHERING)."**

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

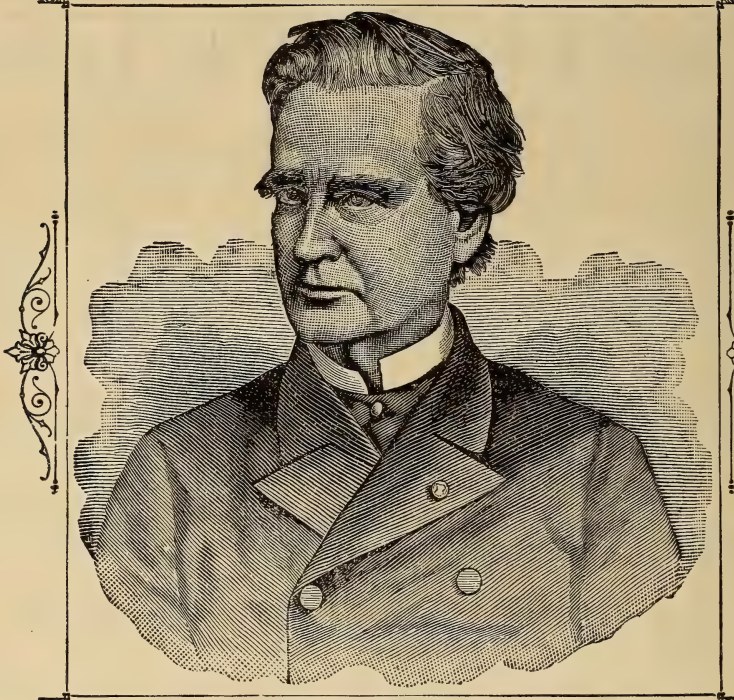
# S. H. KENNEDY'S EXTRACT OF PINUS CANADENSIS.



I have used S. H. KENNEDY'S EXTRACT PINUS CANADENSIS in some affections of the rectum, vagina and cervix uteri. I have used it considerably diluted as a vaginal wash, with great success; but I prefer to apply it to the os tincæ on cotton wool, either pure or mixed with glycerine and rose water. Thus applied, it should remain intact for two or three, or even four days, and then be renewed. In this way I have seen chronic granular erosions, with leucorrhea, disappear very rapidly under its use. I have not time to do more than call the attention of my professional brethren to this new extract, which I am sure will soon be recognized as a valuable addition to our Materia Medica.

J. Marion Sims.

NEW YORK.

*A sample bottle of S. H. KENNEDY'S EXTRACT PINUS CANADENSIS will be sent FREE to any Physician who wishes to test it if he will pay the express charges.*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## CALIFORNIA FIG SYRUP COMPANY

## SAN FRANCISCO, CAL.

LOUISVILLE, KY. NEW YORK, N. Y.

# This is not an Apology.

WASHINGTON, D. C., July 28th, 1893.

I had stopped the further issue of my circular letter of May 15th, as Messrs. Parke, Davis & Co. had informed me that they would cease the sale of their so-called "Cerebrin" under my name. But as they have seen fit to publish in the medical journals, as an advertisement, under the heading of "An apology," a tirade of abuse, almost every line of which expresses a falsehood, additional notice of these people seems to be requisite.

In this screed they give it as *their* opinion that *my* opinions are of no value. This is a point that I may well be excused from discussing; but as the second-named member of the firm in question, and the one who I understand is mainly responsible for the policy of his concern, is the publisher of two books of mine, "Spinal Irritation" and "Sexual Impotence," both of which he has lauded to the profession in what I must confess to be rather fulsome language, he is scarcely in a position to question the value of my opinions. The fact, too, that this firm was so eager to use my name in connection with their counterfeit "Cerebrin" shows that they continued almost up to the present time to attach some worth to my opinions. Who does not know that if I had allowed their disgraceful proceedings to go on unchecked that my opinions in Messrs. Parke, Davis & Co.'s estimation would have retained their pristine value? I exposed them May 15th; therefore my opinions have been unentitled to respect for a little more than two months. "Happy is he," says Lucretius, "who is able to discover the causes of things."

And they conclude their advertisement by announcing that they will still continue to supply "Cerebrin" made after their own formula. A product which they have almost in the same breath acknowledged to be worthless; and which is worthless.

Now, let us see if we cannot from Messrs. Parke, Davis & Co.'s conduct in regard to "Cerebrin" form some idea of the value of their other pharmaceutical preparations.

On the label of the bottle containing their so-called "Cerebrin" is this statement:

"NOTE.—While Dr. Hammond has recommended maceration of the brains for six months, we have modified his method so that we are enabled to thoroughly extract the valuable properties in much less time."

Here is a positive assertion that they have succeeded in extracting the "valuable properties" of the brain of the ox. Did they make this claim recklessly and falsely, without verification, or did they really succeed, as they assert, in obtaining a valuable product from the brain tissue? If the former, what are we to think of a firm manufacturing medical preparations that can seek thus to impose on the public? If the latter, how are we to reconcile their language with that of their latest publication, in which they offer "an apology" for introducing what they now declare to be worthless? Is not such conduct calculated to provoke a feeling of distrust of all the claims they make relative to the superior purity and efficacy of their manufactures? How are we to know, for instance, that they have established the truth of the statement they make in regard to their so called "normal liquids," that—

"These preparations are adjusted to a uniform strength of assay, irrespective of the quantity of crude drug required, thereby imparting to them a definite therapeutic value."

There is a legal maxim that comes to mind in this connection. It is: *Falsus in uno, falsus in omnibus.*

In endeavoring to provide for the purity of the animal extracts, made according to my formulas, by placing the sale of them to the profession in responsible hands and in superintending their manufacture I have done nothing unprofessional. I have fully disclosed the methods of preparing these extracts, and Messrs. Parke, Davis & Co. know perfectly well that they or any one else can manufacture them with impunity, and may even announce them to the profession as being made by my formula, *provided* they are so made; but when Messrs. Parke, Davis & Co. modify my formula, refuse to tell me in what the modification consists, and then announce that the product is made in accordance with my method, they are guilty of conduct that most people would look upon as nefarious and practically scarcely, if at all, to be distinguished from the act of getting money under false pretenses.

It is certainly not to be expected that I should gratuitously provide the public with animal extracts any more than that I should give them my books. Pasteur, Brown-Sequard, Koch, and others who have made important discoveries in medical science are surely entitled, while creating no monopoly in any healing process, to reap some pecuniary reward from their labors, and the propriety of their so doing has never been questioned. Would it be just and right that Dr. Marion Sims, Dr. Weir Mitchell and others who have advanced therapeutics, should refrain from establishing hospitals in which their peculiar methods of treatment can be carried out under their own supervision? Do we not all expect something more than mere thanks for our work? The charge ef being mercenary comes with a bad grace from a drug firm that has never made a single advance in pharmaceutical science, but has gone on year after year watching the procedures of other more original workers and appropriating the results of their labors as soon as they have perceived that money was to be made by so doing.

It would be easy to adduce many instances showing the immanent predatory characteristics of this firm; they have filched right and left, and have even had the hardihood to publish a record of their incursions, into other realms not their own. Wherever they saw a valuable discovery they sailed in to avail themselves of it, nor have they confined themselves to the pharmaceutical profession. Scientific monographs have not escaped them, and with a boldness that would have been admirable if displayed in a good cause they have not hesitated to pirate whatever they thought would advance their trade interests. Here, too, I have been their victim, for without my consent or that of my publishers, Messrs. Appleton & Co., and even without our knowledge, they reprinted in pamphlet form my original paper on the animal extracts, knowing the same to be copyrighted, and sent it broadcast through the country in furtherance of the sale of their bogus product. If this is not a pre-eminent instance of turpitude it would be difficult to find one.

It would be interesting to know just what modification they made in the original process. The probabilities are a thousand to one that it was nothing more than shortening the period of maceration to a few days, and this could only have been done with the "mercenary" ("I thank thee" [Messrs. Parke, Davis & Co.] "for teaching me this word"), object of forestalling the market and getting a quick return for their money.

And what were the "valuable properties" that they declare they extracted from the ox brains? And why did these "valuable properties" suddenly disappear soon after May 15? These are questions the answers to which I am going to wring out of Messrs. Parke, Davis & Co. if there is anything to be gained by the most obdurate persistency.

Finally, I have no disposition to deal hardly with Messrs. Parke, Davis & Co. They have, it is true, been guilty of a mean crime; but I have been actuated more by a desire to reform than to punish them. Many eminent physicians and chemical manufacturers throughout the country inform me that I have rendered a service to the public by exposing the extremely wicked conduct of these people. If I have in addition done good to the wrong-doers my satisfaction will be complete.

WILLIAM A. HAMMOND.

# BROMIDIA.

## BATTLE & CO.

CHEMISTS' CORPORATION,

ST. LOUIS, MO., U. S. A.

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

TO THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

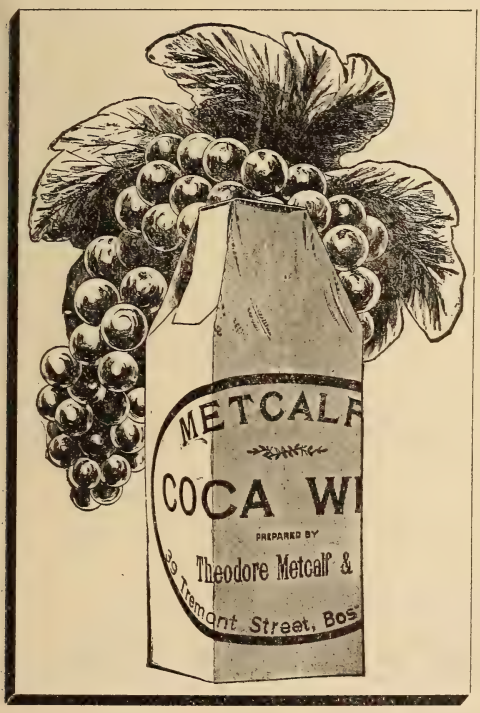
**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**



RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles**, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

# TREATMENT OF TUBERCULOSIS.

The history of modern therapeutics shows a tendency among medical men to oscillate between extremes, like the pendulum, until finally the mean, or practical "point of rest" is reached.

This tendency is particularly noticeable in the treatment of the tubercular diseases. On the one hand we have had the "Gavage" or over-eating system, in which the patient is compelled to endure passive stuffing and absolute rest, in order to combat the so-called "waste of tissue" of the disease.

The fallacy of that theory having been demonstrated by its continued failure in actual practice, we seem to have swung to the opposite extreme of considering the patient as an indifferent receptacle of disease germs, into which it is sufficient to simply inject the appropriate germicide to effect a cure. So we have the various lymphs, antiseptic fluids, and other purely germicidal methods of treatment. But the results are showing that the *patient* refuses to be ignored as a factor in the case. The dead germs and the dead patient are buried together.

We see that the principle is as sound in medicine as it is in philanthropy, that the true help is that which enables the person to help himself. This is the principle upon which the treatment with the hypophosphites of lime and soda is based.

Each individual patient is composed of a collection of cells possessing vital powers. In tuberculosis these vital powers of the cells, and hence of the patient, are weakened. But by administering this remedy judiciously we gradually restore the cells again to their normal condition, enabling them to battle successfully with the invading bacilli, and to repair gradually the damage done to the tissue structures. Thus the organism requires additional strength with each step in advance, and the cure is finally complete.

Many, no doubt, have at some time in their experience touched upon the hypophosphites. They have given them in oil, in malt extract, in some acid mixture, or in a compound with a half a dozen "tonics" added to it, and have been disappointed. The illustrious founder of this successful mode of treatment, Dr. Churchill, did not recommend any such heterogeneous mixtures of foreign substances, and his remedy should not be held responsible for the consequent failures. He simply urged that the chemically pure hypophosphites of lime and soda should be administered with judgment, perseveringly, until a permanent cure resulted. Pharmacists, ambitious of getting up rival preparations, have made the attempted improvements. It is needless to say that wherever these innovations have been adopted, failure has resulted, and the entire treatment has been brought into disrepute and abandoned.

With the pure hypophosphites of lime and soda you can score success time and again. The results are gradual, steady and certain if the remedy is persevered with faithfully, until the cure is complete. None but chemicals of known genuineness and absolute purity should be used. McArthur's Syrup is prepared on the principle laid down by Dr. Churchill. It contains the chemically pure hypophosphites of lime and soda, uncomplicated with other drugs, in a pure and wholesome syrup. If you would like to study this subject more closely the McArthur Hypophosphite Co., Boston, Mass., will send you, free, a pamphlet on "The Treatment and Curability of Consumption."

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.

## THE JEFFERSON MEDICAL COLLEGE
## OF PHILADELPHIA.

**The Annual Session of the Jefferson Medical College begins October 2d, and continues over seven months. Preliminary Lectures will be held from 25th of September.**

### COURSE OF INSTRUCTION AND FACILITIES.

Three years of graded instruction are required of candidates presenting themselves for the degree of M. D., but the voluntary fourth-year course which is now offered is strongly recommended. The instruction consists in didactic lectures, amply supplemented by clinical teaching at the bedside and in the laboratories and dispensaries.

In addition to the members of the Faculty there is a large corps of experienced instructors who assist the professors in practical work in the laboratories or in bedside work at the hospitals and dispensaries. Every student is personally taught, by dividing the class into small sections.

Daily instruction in the practical branches is given in the Hospital of the College, is a special feature of the course in the second and third years, and is without extra charge.

The Annual Announcement, giving full particulars, will be sent on application to

**J. W. HOLLAND, M. D., Dean.**

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## University of Maryland,

### FACULTY OF PHYSIC,

**BALTIMORE, MD.**

The Eighty-Seventh Annual Session commences October 2d, 1893, and ends in April, 1894. Large amount of clinical material, and ample facilities for work in chemical and histological laboratories and in the dissecting room. Each graduate has personal experience in obstetrics.

For Catalogue and other information, address

**Dr. J. EDWIN MICHAEL,**
**201 W. Franklin St., Baltimore.**

### DENTAL DEPARTMENT.

Session begins October 2d, 1893. For Catalogue, address

# SALIPYRIN=RIEDEL

**ANALGESIC**
**ANTIPYRETIC**
**ANTI=RHEUMATIC**

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,

**Horace Tracy Hanks,** M.D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# This is not an Apology.

WASHINGTON, D. C., July 28th, 1893.

I had stopped the further issue of my circular letter of May 15th, as Messrs. Parke, Davis & Co. had informed me that they would cease the sale of their so-called "Cerebrin" under my name. But as they have seen fit to publish in the medical journals, as an advertisement, under the heading of "An apology," a tirade of abuse, almost every line of which expresses a falsehood, additional notice of these people seems to be requisite. In this screed they give it as *their* opinion that *my* opinions are of no value. This is a point that I may well be excused from discussing; but as the second-named member of the firm in question, and the one who I understand is mainly responsible for the policy of his concern, is the publisher of two books of mine, "Spinal Irritation" and "Sexual Impotence," both of which he has lauded to the profession in what I must confess to be rather fulsome language, he is scarcely in a position to question the value of my opinions. The fact, too, that this firm was so eager to use my name in connection with their counterfeit "Cerebrin" shows that they continued almost up to the present time to attach some worth to my opinions. Who does not know that if I had allowed their disgraceful proceedings to go on unchecked that my opinions in Messrs. Parke, Davis & Co.'s estimation would have retained their pristine value? I exposed them May 15th; therefore my opinions have been unentitled to respect for a little more than two months. "Happy is he," says Lucretius, "who is able to discover the causes of things."

And they conclude their advertisement by announcing that they will still continue to supply "Cerebrin" made after their own formula. A product which they have almost in the same breath acknowledged to be worthless; and which is worthless.

Now, let us see if we cannot from Messrs. Parke, Davis & Co.'s conduct in regard to "Cerebrin" form some idea of the value of their other pharmaceutical preparations.

On the label of the bottle containing their so-called "Cerebrin" is this statement:

"NOTE.—While Dr. Hammond has recommended maceration of the brains for six months, we have modified his method so that we are enabled to thoroughly extract the valuable properties in much less time."

Here is a positive assertion that they have succeeded in extracting the "valuable properties" of the brain of the ox. Did they make this claim recklessly and falsely, without verification, or did they really succeed, as they assert, in obtaining a valuable product from the brain tissue? If the former, what are we to think of a firm manufacturing medical preparations that can seek thus to impose on the public? If the latter, how are we to reconcile their language with that of their latest publication, in which they offer "an apology" for introducing what they now declare to be worthless? Is not such conduct calculated to provoke a feeling of distrust of all the claims they make relative to the superior purity and efficacy of their manufactures? How are we to know, for instance, that they have established the truth of the statement they make in regard to their so called "normal liquids," that—

"These preparations are adjusted to a uniform strength of assay, irrespective of the quantity of crude drug required, thereby imparting to them a definite therapeutic value."

There is a legal maxim that comes to mind in this connection. It is: *Falsus in uno, falsus in omnibus.*

In endeavoring to provide for the purity of the animal extracts, made according to my formulas, by placing the sale of them to the profession in responsible hands and in superintending their manufacture I have done nothing unprofessional. I have fully disclosed the methods of preparing these extracts, and Messrs. Parke, Davis & Co. know perfectly well that they or any one else can manufacture them with impunity, and may even announce them to the profession as being made by my formula, *provided* they are so made; but when Messrs. Parke, Davis & Co. modify my formula, refuse to tell me in what the modification consists, and then announce that the product is made in accordance with my method, they are guilty of conduct that most people would look upon as nefarious and practically scarcely, if at all, to be distinguished from the act of getting money under false pretenses.

It is certainly not to be expected that I should gratuitously provide the public with animal extracts any more than that I should give them my books. Pasteur, Brown-Sequard, Koch, and others who have made important discoveries in medical science are surely entitled, while creating no monopoly in any healing process, to reap some pecuniary reward from their labors, and the propriety of their so doing has hever been questioned. Would it be just and right that Dr. Marion Sims, Dr. Weir Mitchell and others who have advanced therapeutics, should refrain from establishing hospitals in which their peculiar methods of treatment can be carried out under their own supervision? Do we not all expect something more than mere thanks for our work? The charge ef being mercenary comes with a bad grace from a drug firm that has never made a single advance in pharmaceutical science, but has gone on year after year watching the procedures of other more original workers and appropriating the results of their labors as soon as they have perceived that money was to be made by so doing.

It would be easy to adduce many instances showing the immanent predatory characteristics of this firm; they have filched right and left, and have even had the hardihood to publish a record of their incursions, into other realms not their own. Wherever they saw a valuable discovery they sailed in to avail themselves of it, nor have they confined themselves to the pharmaceutical profession. Scientific monographs have not escaped them, and with a boldness that would have been admirable if displayed in a good cause they have not hesitated to pirate whatever they thought would advance their trade interests. Here, too, I have been their victim, for without my consent or that of my publishers, Messrs. Appleton & Co., and even without our knowledge, they reprinted in pamphlet form my original paper on the animal extracts, knowing the same to be copyrighted, and sent it broadcast through the country in furtherance of the sale of their bogus product. If this is not a pre-eminent instance of turpitude it would be difficult to find one.

It would be interesting to know just what modification they made in the original process. The probabilities are a thousand to one that it was nothing more than shortening the period of maceration to a few days, and this could only have been done with the "mercenary" ("I thank thee" [Messrs. Parke, Davis & Co.] "for teaching me this word"), object of forestalling the market and getting a quick return for their money.

And what were the "valuable properties" that they declare they extracted from the ox brains? And why did these "valuable properties" suddenly disappear soon after May 15? These are questions the answers to which I am going to wring out of Messrs. Parke, Davis & Co. if there is anything to be gained by the most obdurate persistency.

Finally, I have no disposition to deal hardly with Messrs. Parke, Davis & Co. They have, it is true, been guilty of a mean crime; but I have been actuated more by a desire to reform than to punish them. Many eminent physicians and chemical manufacturers throughout the country inform me that I have rendered a service to the public by exposing the extremely wicked conduct of these people. If I have in addition done good to the wrong-doers my satisfaction will be complete.

WILLIAM A. HAMMOND.

# SCHERING'S Pharmaceutical Specialties

**Piperazine.**
The unsurpassed Uric Acid Solvent.

**Phenocoll Hydrochloride.**
Readily *Soluble* Antipyretic, Antirheumatic, Nervine, Analgesic and Antiperiodic.

**Chloralamid.**
The most harmless Hypnotic and Anodyne.

**Chloral-Caffeine.**
Antirheumatic, also a useful remedy in serious cases of constipation.

**Benzonaphthol.**
Chemically pure, Intestinal Antiseptic.

**Silver Phosphate Solution.**
An alkaline Caustic and Astringent; not corrosive; does not coagulate albumen.

**Thiosinamin.**
New remedy for Phthisis and Lupus.

**Camphoric Acid.**
Excellent alterative for mucous membranes.

**Strontium Salts.**
Bromide, Carbonate, Iodide, Lactate, etc., perfectly pure.

**FORMALIN.** : : : : : : : :
This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1⅓ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

# Dysmenorrhea.

• • •

DYSMENORRHEA.—The experience of the profession demonstrates that ALETRIS CORDIAL (Rio) given in teaspoonful doses, three times a day, not only relieves dysmenorrhea, but taken continuously, usually effects a permanent cure. It is also of the utmost value in prolapsus uteri and all derangements of the uterus. Being strictly a uterine tonic, it has a direct affinity for the reproductive organs, and exercises a healthy tonicity over their functional activity. It is the female tonic par excellence.

I used ALETRIS CORDIAL with very good results, in the case of Mrs. ———, aged 23. Since the birth of her child five years ago, she has been in a very poor state of health. At the time I saw her she was very much reduced. She also, since the birth of her child, had suffered with dysmenorrhea of a most severe type, the pain usually beginning three or four days before the appearance of the menstrual flow, and lasting until one or two days after, its appearance being so severe as to confine her to her bed. She was also very nervous, had not much appetite, and did not sleep well. I ordered one teaspoonful of ALETRIS CORDIAL, three times daily, beginning one week before the appearance of the menstrual flow, and continued for two weeks, then to discontinue its use until a week before the next period. In conjunction, she also took one teaspoonful of CELERINA one hour after each meal, as I thought it would be beneficial, on account of her nervous condition. I began to notice improvement in a short time, and at the next menstrual period there was but little pain. From that time on there was marked improvement, until at the end of two months she was free from pain at the catamenial periods. The nervous phenomena improved, as did also her appetite, until she is now, according to statement made to me yesterday, in better health than she has been for six years.

J. A. McMURRAY, M.D., Marion, Ohio.

I have found ALETRIS CORDIAL to be invaluable in cases of amenorrhea and in dysmenorrhea, and I prescribe it very often. JOHN CALDWELL, M.D.,
Shott's Iron Works, Lanarkshire, Scotland.

After having made due trial, I found that ALETRIS CORDIAL is a powerful regulator of uterine circulation. It is as efficacious in cases of dysmenorrhea as in those of metrorrhagia. DR. J. ZABE, Paris, France.

I have found ALETRIS CORDIAL to give great relief in dysmenorrhea. In fact it has succeeded where most of the well-known remedies have failed.

H. LLOYD WHITESTONE, L.R.C.S.I., &c.,
The Terrace, West Bromwich, London, England.

After having given ALETRIS CORDIAL a trial, I am glad to say I can speak highly of it, on account of the results I obtained from its use in a case of dysmenorrhea. I shall certainly continue to prescribe it. T. D. WHITE, M.D.,
40 Elgin Ave., Paddington, London, W., England.

# SOLUBLE
# ELASTIC CAPSULES.

These Capsules are prepared from the finest French Gelatin by improved processes and apparatus, and are very soluble and easy to swallow.

In them physicians have a superior means for the administration of drugs possessing pungent, acrid or oily properties. They are made in the following sizes: 15 grammes, 10 grammes, 5 grammes, 2½ grammes, 10 minims.

Among the many methods of administering medicaments the Soluble Elastic Capsule is growing to be one of the most favored. Among those which are very much sought after are the following:

Cascara Sagrada Extract, 1, 2 and 3 grains.

Quinine Sulphate, 1 to 5 grains.

Quinine Muriate, 2 to 3 grains.

Male-Fern and Kamala. [Formula.—Oleo-Resin Male-Fern, 7 minims; Kamala, sifted, 4 grains.]

Pichi Extract, 5 grains.

Warburg's Tincture. [Each capsule represents two drachms of Warburg's Tincture in a concentrated form.]

Liquor Sedans, a utero-ovarian sedative and anodyne. [Formula.—Each fluidounce represents: Black Haw, 60 grains; Golden Seal, 60 grains, containing its chief alkaloidal constituents; Jamaica Dogwood, 30 grains; combined with aromatics.]

Santonin and Castor Oil. [Santonin, $\frac{1}{10}$ grain; Castor Oil, 40 minims.]

*Send for complete descriptive catalogue of our Soluble Elastic Capsules giving formulæ for all contained in the list.*

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

To THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.

CONTAINS IN PALATABLE FORM, SUCH

EXCELLENT TONICS AS STRYCHNIA, IRON, GENTIAN, CALISAYA, COCA, VIBURNUM AND AROMATICS, BESIDES PEPSINE.

DOSE ONE TEASPOONFUL BEFORE MEALS

PREPARED ONLY BY THE TILDEN COMPANY NEW LEBANON N.Y.

ST. LOUIS BRANCH, ST. LOUIS, MO.

# SYR. HYPOPHOS. CO., FELLOWS

**Contains the Essential Elements** of the Animal Organization—Potash and Lime;

**The Oxidizing Agents**—Iron and Manganese;

**The Tonics**—Quinine and Strychnine;

**And the Vitalizing Constituent**—Phosphorus; the whole combined in the form of a Syrup with a **Slightly Alkaline Reaction.**

**It Differs in its Effects from all Analogous Preparations;** and it possesses the important properties of being pleasant to the taste, easily borne by the stomach, and harmless under prolonged use.

**It has Gained a Wide Reputation,** particularly in the treatment of Pulmonary Tuberculosis, Chronic Bronchitis, and other affections of the respiratory organs. It has also been employed with much success in various nervous and debilitating diseases.

**Its Curative Power** is largely attributable to its stimulant, tonic, and nutritive properties, by means of which the energy of the system is recruited.

**Its Action is Prompt;** it stimulates the appetite and the digestion, it promotes assimilation, and it enters directly into the circulation with the food products.

The prescribed dose produces a feeling of buoyancy, and removes depression and melancholy; *hence the preparation is of great value in the treatment of mental and nervous affections.* From the fact, also, that it exerts a double tonic influence, and induces a healthy flow of the secretions, its use is indicated in a wide range of diseases.

## NOTICE—CAUTION.

The success of Fellows' Syrup of Hypophosphites has tempted certain persons to offer imitations of it for sale. Mr. Fellows, who has examined samples of several of these, ***finds that no two of them are identical,*** and that all of them differ from the original in composition, in freedom from acid reaction, in susceptibility to the effects of oxygen when exposed to light or heat, ***in the property of retaining the strychnine in solution,*** and in the medicinal effects.

As these cheap and inefficient substitutes are frequently dispensed instead of the genuine preparation, physicians are earnestly requested, when prescribing the Syrup, to write "Syr. Hypophos. ***Fellows.***"

As a further precaution, it is advisable that the Syrup should be ordered in the original bottles; the distinguishing marks which the bottles (and the wrappers surrounding them) bear, can then be examined, and the genuineness—or otherwise—of the contents thereby proved.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.
Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles 12.00.

## MEDICAL DEPARTMENT OF THE COLUMBIAN UNIVERSITY.

WASHINGTON, D. C.

ANNOUNCEMENT, 1893—'94.

The Seventy-second Session will begin October 1st, 1893, and continue seven months. Graded four year course required. Ample clinical facilities.

FACULTY:

J. F. THOMPSON, Surgery.
W. W. JOHNSTON, Practice.
A. F. A. KING, Obstetrics.
E. A. DE SCHWEINITZ, Chemistry.
WM. P. CARR, Physiology.
D. W. PRENTISS, Therapeutics.
D. K. SHUTE, Anatomy.
H. C. YARROW, Dermatology.
G. B. HARRISON, Pediatrics.
THEO. SMITH, Bacteriology and Hygiene.
T. E. McARDLE, Minor Surgery.
H. L. E. JOHNSON, Gynæcology.
G. N. ACKER, Pathological Histology.
W. M. GRAY, Normal Histology.
W. K. BUTLER, Ophthalmology.
S. RUFFIN, Medical Jurisprudence.
C. W. RICHARDSON, Laryngology and Otology.
A. C. PATTERSON, Mental Diseases.
E. L. TOMPKINS, Neurology.

For circulars, address **A. F. A. KING, M. D., Dean,**
1315 Massachussets Avenue, N. W., Washington, D. C.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

## WALNUT LODGE HOSPITAL

HARTFORD, CONNECTICUT.

Organized in 1880 for the special medical treatment of
ALCOHOL AND OPIUM INEBRIATES.

Elegantly situated in the suburbs of the city, with every appointment and appliance for the treatment of this class of cases, including Turkish Bath, Russian, Roman, Saline and Medicated Baths. This institution is founded on the well-recognized fact that INEBRIETY IS A DISEASE AND CURABLE.

Applications and all inquiries should be addressed
T. D. CROTHERS, M.D.,

# PIPERAZIN

## URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

**Caution**:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

**"PIPERAZIN (SCHERING)."**

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

**Sole Agents in U. S. LEHN & FINK, NEW YORK.**

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

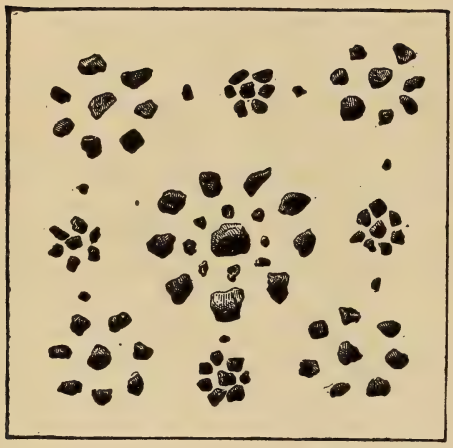

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

## THE JACKSON SANATORIUM

offers exceptional advantages and attractions

This institution is under the personal care of a permanent staff of regularly educated and experienced physicians

Location, 1,200 feet above sea level, in a woodland park, overlooking charming upland and valley views of Genesee region. Pure spring water from rocky heights. Clear, dry atmosphere, free from fogs and malaria. Perfect drainage and sewerage systems. Delightful walks and drives.

Elegant (brick and iron) fire-proof main building and twelve cottages, steam heated, and designed to meet every requirement of invalids, or seekers of rest and quiet.

Extensive apartments for treatment arranged for individual privacy. Skilled attendants. All forms of baths, Electricity, Massage, Swedish Movements, etc., scientifically administered.

**Culinary Department under Supervision of Mrs. Emma P. Ewing,** Superintendent of the Chautauqua Cooking School, whose reputation as a teacher of scientific and hygienic cooking is national.

Comfort without care; freedom from taxations of fashionable life and from the excitements and temptations of popular resorts. Especial provision for quiet and rest, also for recreation, amusement, and regular out-door life. Telegraph, telephone, electric bells, safety elevator, open fires, and all modern appliances for comfort and health On direct line of Del. Lack. & West. R. R. between New York City and Buffalo. Only 9 hours from New York.

**Established in 1858.**
**Open all the year.**

# Treatment of Cholera.

**Dr. Chas. Gatchell,** of Chicago, in his "*Treatment of Cholera,*" says: "As it is known that the cholera microbe does not flourish in acid solutions, it would be well to slightly acidulate the drinking water. This may be done by adding to each glass of water half a teaspoonful of **Horsford's Acid Phosphate.** This will not only render the water of an acid reaction, but also render boiled water more agreeable to the taste. It may be sweetened if desired. The **Acid Phosphate,** taken as recommended, will also tend to invigorate the system and correct debility, thus giving increased power of resistance to disease. It is the acid of the system, a product of the gastric functions, and hence, will not create that disturbance liable to follow the use of mineral acids."

**Send for descriptive circular. Physicians who wish to test it will be furnshed, upon application, with a sample, by mail, or a full sized bottle without expense, except express charges. Prepared under the direction of Prof. E. N. Horsford, by the**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## CALIFORNIA FIG SYRUP COMPANY

## SAN FRANCISCO, CAL.

## LOUISVILLE, KY. NEW YORK, N. Y.

# This is not an Apology.

WASHINGTON, D. C., July 28th, 1893.

I had stopped the further issue of my circular letter of May 15th, as Messrs. Parke, Davis & Co. had informed me that they would cease the sale of their so-called "Cerebrin" under my name. But as they have seen fit to publish in the medical journals, as an advertisement, under the heading of "An apology," a tirade of abuse, almost every line of which expresses a falsehood, additional notice of these people seems to be requisite. In this screed they give it as *their* opinion that *my* opinions are of no value. This is a point that I may well be excused from discussing; but as the second-named member of the firm in question, and the one who I understand is mainly responsible for the policy of his concern, is the publisher of two books of mine, "Spinal Irritation" and "Sexual Impotence," both of which he has lauded to the profession in what I must confess to be rather fulsome language, he is scarcely in a position to question the value of my opinions. The fact, too, that this firm was so eager to use my name in connection with their counterfeit "Cerebrin" shows that they continued almost up to the present time to attach some worth to my opinions. Who does not know that if I had allowed their disgraceful proceedings to go on unchecked that my opinions in Messrs. Parke, Davis & Co.'s estimation would have retained their pristine value? I exposed them May 15th; therefore my opinions have been unentitled to respect for a little more than two months. "Happy is he," says Lucretius, "who is able to discover the causes of things."

And they conclude their advertisement by announcing that they will still continue to supply "Cerebrin" made after their own formula. A product which they have almost in the same breath acknowledged to be worthless; and which is worthless.

Now, let us see if we cannot from Messrs. Parke, Davis & Co.'s conduct in regard to "Cerebrin" form some idea of the value of their other pharmaceutical preparations.

On the label of the bottle containing their so-called "Cerebrin" is this statement:

"NOTE.—While Dr. Hammond has recommended maceration of the brains for six months, we have modified his method so that we are enabled to thoroughly extract the valuable properties in much less time."

Here is a positive assertion that they have succeeded in extracting the "valuable properties" of the brain of the ox. Did they make this claim recklessly and falsely, without verification, or did they really succeed, as they assert, in obtaining a valuable product from the brain tissue? If the former, what are we to think of a firm manufacturing medical preparations that can seek thus to impose on the public? If the latter, how are we to reconcile their language with that of their latest publication, in which they offer "an apology" for introducing what they now declare to be worthless? Is not such conduct calculated to provoke a feeling of distrust of all the claims they make relative to the superior purity and efficacy of their manufactures? How are we to know, for instance, that they have established the truth of the statement they make in regard to their so called "normal liquids," that—

"These preparations are adjusted to a uniform strength of assay, irrespective of the quantity of crude drug required, thereby imparting to them a definite therapeutic value."

There is a legal maxim that comes to mind in this connection. It is: *Falsus in uno, falsus in omnibus.*

In endeavoring to provide for the purity of the animal extracts, made according to my formulas, by placing the sale of them to the profession in responsible hands and in superintending their manufacture I have done nothing unprofessional. I have fully disclosed the methods of preparing these extracts, and Messrs. Parke, Davis & Co. know perfectly well that they or any one else can manufacture them with impunity, and may even announce them to the profession as being made by my formula, *provided* they are so made; but when Messrs. Parke, Davis & Co. modify my formula, refuse to tell me in what the modification consists, and then announce that the product is made in accordance with my method, they are guilty of conduct that most people would look upon as nefarious and practically scarcely, if at all, to be distinguished from the act of getting money under false pretenses.

It is certainly not to be expected that I should gratuitously provide the public with animal extracts any more than that I should give them my books. Pasteur, Brown-Sequard, Koch, and others who have made important discoveries in medical science are surely entitled, while creating no monopoly in any healing process, to reap some pecuniary reward from their labors, and the propriety of their so doing has hever been questioned. Would it be just and right that Dr. Marion Sims, Dr. Weir Mitchell and others who have advanced therapeutics, should refrain from establishing hospitals in which their peculiar methods of treatment can be carried out under their own supervision? Do we not all expect something more than mere thanks for our work? The charge ef being mercenary comes with a bad grace from a drug firm that has never made a single advance in pharmaceutical science, but has gone on year after year watching the procedures of other more original workers and appropriating the results of their labors as soon as they have perceived that money was to be made by so doing.

It would be easy to adduce many instances showing the immanent predatory characteristics of this firm; they have filched right and left, and have even had the hardihood to publish a record of their incursions, into other realms not their own. Wherever they saw a valuable discovery they sailed in to avail themselves of it, nor have they confined themselves to the pharmaceutical profession. Scientific monographs have not escaped them, and with a boldness that would have been admirable if displayed in a good cause they have not hesitated to pirate whatever they thought would advance their trade interests. Here, too, I have been their victim, for without my consent or that of my publishers, Messrs. Appleton & Co., and even without our knowledge, they reprinted in pamphlet form my original paper on the animal extracts, knowing the same to be copyrighted, and sent it broadcast through the country in furtherance of the sale of their bogus product. If this is not a pre-eminent instance of turpitude it would be difficult to find one.

It would be interesting to know just what modification they made in the original process. The probabilities are a thousand to one that it was nothing more than shortening the period of maceration to a few days, and this could only have been done with the "mercenary" ("I thank thee" [Messrs. Parke, Davis & Co.] "for teaching me this word"), object of forestalling the market and getting a quick return for their money.

And what were the "valuable properties" that they declare they extracted from the ox brains? And why did these "valuable properties" suddenly disappear soon after May 15? These are questions the answers to which I am going to wring out of Messrs. Parke, Davis & Co. if there is anything to be gained by the most obdurate persistency.

Finally, I have no disposition to deal hardly with Messrs. Parke, Davis & Co. They have, it is true, been guilty of a mean crime; but I have been actuated more by a desire to reform than to punish them. Many eminent physicians and chemical manufacturers throughout the country inform me that I have rendered a service to the public by exposing the extremely wicked conduct of these people. If I have in addition done good to the wrong-doers my satisfaction will be complete.

## HERNIA

ITS RADICAL AND TENTATIVE TREATMENT, IN INFANT CHILDREN AND ADULTS

BY

THOMAS H. MANLEY, A.M., M.D.,

Visiting Surgeon to Harlem Hospital, Consulting Surgeon to the Fordham Hospital, Member of American Medical Association, New York State-Medical Association, New York County Medical Association, New York Academy of Medicine, Pathological Society, National Association of Railway Surgeons, etc., etc.

This work is illustrated by 65 engravings and drawings with a full history of the ancient and modern operations for the Hernial Infirmity of every type, in both sexes, along with a full description of the varied anatomical types of the conditions and the multiplicy of technique of modern times; it also embraces an entire chapter on cocaine analgesia as a substitute for pulmonary anaesthesia, with a full complete set of rules for its indications and technique. Price $3.00 mailed to any address.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALCIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

Physician's Sample Bottles, by express, carriage prepaid, upon the receipt of One Dollar.

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

THE ELIX-IODO-BROMIDE of CALCIUM COMPOUND, a positive alterative, (an acquaintance of the general practitioner for many years) is uniformly acceptable in ailments in which Iodide of Potash alone fails.
A FURTHER ADVANTAGE: It can be combined with the Mercurial Salts without precipitation, rendering it extremely valuable in the mixed treatment of SYPHILIS.
It is IDEAL in the treatment of Syphilis where Mercury is withdrawn and Iodine preparations substituted: SUPREME in the aggregation stage or late manifestation of the DISEASE

Its USEFULNESS has been TESTED IN THOSE CONDITIONS which were formerly known as SCROFULA, but which a new era considers to be TUBERCULOSIS, such as chronic affections of the bones and joints, tubercular diseases of the skin, chronic enlargements of lymphatic glands, chronic tonsillitis, etc
THE IODINE preparations are PAR EXCELLENCE the only remedies of undoubted value in those chronic processes where alterative medication is required. Our preparation of IODO-BROMIDE of CALCIUM has received SPECIAL INDORSEMENT.

MAIL US YOUR Name and Address and we will send book of TESTIMONIALS.

**THE THOMAS FOREIGN TOURIST CO.**

1512 CHESTNUT STREET PHILADELPHIA

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

TO THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.

Charles B. Perkins & Co., Selling Agts., 36 Kilby St., Boston.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

# SALIPYRIN=RIEDEL

ANALGESIC
ANTIPYRETIC
ANTI=RHEUMATIC

SALIPYRIN ($C_{18}H_{18}N_2O_4$) is a *chemical combination* of 57.7 per cent. phenyl-dimethyl-pyrazolon and 42.3 per cent. salicylic acid; it dissolves readily in alcohol, and in about 200 parts of water. Dose: ½ to 2 grammes; daily maximum, 6 to 8 grammes. It is best administered in powder form (in wafers, cachets, capsules, etc.), or in mixture—rubbed up with glycerin and flavored with raspberry syrup.

Its chief advantages are comparative harmlessness, no cardiac influence, and freedom from unpleasant side and after-effects. Especially favorable results have been achieved with it in Influenza, Neuralgia, and all Rheumatic affections.

MANUFACTURED ONLY BY
J. D. RIEDEL,
BERLIN, Germany.

SOLE AGENTS & LICENSEES:
LEHN & FINK,
NEW YORK.

**Horace Tracy Hanks,** M. D., *Member of the Co. Med. Soc., N.Y. State Med. Soc., N.Y. Academy of Medicine, N.Y. Obstetrical Society, etc., Surgeon Woman's Hospital.*

I want to call attention to LYSOL, which I believe in a one-per-cent. solution is a much better antiseptic to handle than carbolic acid or mercuric bi-chloride. It is something like creolin. It mixes with water. A one per cent. solution is amply sufficient to cleanse the hands, and a one-half per cent. solution is strong enough for vaginal injection. It is soothing to the hands, when not too strong, and costs less than carbolic acid. I have used it for some months, and have used it to the exclusion of other germicides in seven laparotomies during the last four weeks; in each case my patients have done well. —Transactions of the New York Obstetrical Society, Stated Meeting, Feb. 16, 1892.—*N.Y. Journ. Gyn. & Obstetrics.*

# This is not an Apology.

WASHINGTON, D. C., July 28th, 1893.

I had stopped the further issue of my circular letter of May 15th, as Messrs. Parke, Davis & Co. had informed me that they would cease the sale of their so-called "Cerebrin" under my name. But as they have seen fit to publish in the medical journals, as an advertisement, under the heading of "An apology," a tirade of abuse, almost every line of which expresses a falsehood, additional notice of these people seems to be requisite.

In this screed they give it as *their* opinion that *my* opinions are of no value. This is a point that I may well be excused from discussing; but as the second-named member of the firm in question, and the one who I understand is mainly responsible for the policy of his concern, is the publisher of two books of mine, "Spinal Irritation" and "Sexual Impotence," both of which he has lauded to the profession in what I must confess to be rather fulsome language, he is scarcely in a position to question the value of my opinions. The fact, too, that this firm was so eager to use my name in connection with their counterfeit "Cerebrin" shows that they continued almost up to the present time to attach some worth to my opinions. Who does not know that if I had allowed their disgraceful proceedings to go on unchecked that my opinions in Messrs. Parke, Davis & Co.'s estimation would have retained their pristine value? I exposed them May 15th; therefore my opinions have been unentitled to respect for a little more than two months. "Happy is he," says Lucretius, "who is able to discover the causes of things."

And they conclude their advertisement by announcing that they will still continue to supply "Cerebrin" made after their own formula. A product which they have almost in the same breath acknowledged to be worthless; and which is worthless.

Now, let us see if we cannot from Messrs. Parke, Davis & Co.'s conduct in regard to "Cerebrin" form some idea of the value of their other pharmaceutical preparations.

On the label of the bottle containing their so-called "Cerebrin" is this statement:

"NOTE.—While Dr. Hammond has recommended maceration of the brains for six months, we have modified his method so that we are enabled to thoroughly extract the valuable properties in much less time."

Here is a positive assertion that they have succeeded in extracting the "valuable properties" of the brain of the ox. Did they make this claim recklessly and falsely, without verification, or did they really succeed, as they assert, in obtaining a valuable product from the brain tissue? If the former, what are we to think of a firm manufacturing medical preparations that can seek thus to impose on the public? If the latter, how are we to reconcile their language with that of their latest publication, in which they offer "an apology" for introducing what they now declare to be worthless? Is not such conduct calculated to provoke a feeling of distrust of all the claims they make relative to the superior purity and efficacy of their manufactures? How are we to know, for instance, that they have established the truth of the statement they make in regard to their so called "normal liquids," that—

"These preparations are adjusted to a uniform strength of assay, irrespective of the quantity of crude drug required, thereby imparting to them a definite therapeutic value."

There is a legal maxim that comes to mind in this connection. It is: *Falsus in uno, falsus in omnibus.*

In endeavoring to provide for the purity of the animal extracts, made according to my formulas, by placing the sale of them to the profession in responsible hands and in superintending their manufacture I have done nothing unprofessional. I have fully disclosed the methods of preparing these extracts, and Messrs. Parke, Davis & Co. know perfectly well that they or any one else can manufacture them with impunity, and may even announce them to the profession as being made by my formula, *provided* they are so made; but when Messrs. Parke, Davis & Co. modify my formula, refuse to tell me in what the modification consists, and then announce that the product is made in accordance with my method, they are guilty of conduct that most people would look upon as nefarious and practically scarcely, if at all, to be distinguished from the act of getting money under false pretenses.

It is certainly not to be expected that I should gratuitously provide the public with animal extracts any more than that I should give them my books. Pasteur, Brown-Sequard, Koch, and others who have made important discoveries in medical science are surely entitled, while creating no monopoly in any healing process, to reap some pecuniary reward from their labors, and the propriety of their so doing has never been questioned. Would it be just and right that Dr. Marion Sims, Dr. Weir Mitchell and others who have advanced therapeutics, should refrain from establishing hospitals in which their peculiar methods of treatment can be carried out under their own supervision? Do we not all expect something more than mere thanks for our work? The charge of being mercenary comes with a bad grace from a drug firm that has never made a single advance in pharmaceutical science, but has gone on year after year watching the procedures of other more original workers and appropriating the results of their labors as soon as they have perceived that money was to be made by so doing.

It would be easy to adduce many instances showing the immanent predatory characteristics of this firm; they have filched right and left, and have even had the hardihood to publish a record of their incursions, into other realms not their own. Wherever they saw a valuable discovery they sailed in to avail themselves of it, nor have they confined themselves to the pharmaceutical profession. Scientific monographs have not escaped them, and with a boldness that would have been admirable if displayed in a good cause they have not hesitated to pirate whatever they thought would advance their trade interests. Here, too, I have been their victim, for without my consent or that of my publishers, Messrs. Appleton & Co., and even without our knowledge, they reprinted in pamphlet form my original paper on the animal extracts, knowing the same to be copyrighted, and sent it broadcast through the country in furtherance of the sale of their bogus product. If this is not a pre-eminent instance of turpitude it would be difficult to find one.

It would be interesting to know just what modification they made in the original process. The probabilities are a thousand to one that it was nothing more than shortening the period of maceration to a few days, and this could only have been done with the "mercenary" ("I thank thee" [Messrs. Parke, Davis & Co.] "for teaching me this word"), object of forestalling the market and getting a quick return for their money.

And what were the "valuable properties" that they declare they extracted from the ox brains? And why did these "valuable properties" suddenly disappear soon after May 15? These are questions the answers to which I am going to wring out of Messrs. Parke, Davis & Co. if there is anything to be gained by the most obdurate persistency.

Finally, I have no disposition to deal hardly with Messrs. Parke, Davis & Co. They have, it is true, been guilty of a mean crime; but I have been actuated more by a desire to reform than to punish them. Many eminent physicians and chemical manufacturers throughout the country inform me that I have rendered a service to the public by exposing the extremely wicked conduct of these people. If I have in addition done good to the wrong-doers my satisfaction will be complete.

WILLIAM A. HAMMOND.

This new harmless Germicide has a germicidal action superior to Corrosive Sublimate, without its toxicity and mixes in all proportions with water. At ordinary temperatures even, **FORMALIN** gives off Gaseous Formic Aldehyd, and the evolution of Gas is, of course, accelerated by application of heat.

Drs. J. STAHL, BERLIOZ and FRILLAT, found that Anthrax Bacilli were killed by a solution of 1:50,000, while Aaronson stated that solutions of 1:20,000 prevented the development of Typhus and Anthrax Bacilli, as well as that of Staphylococcus Pyogenes Aureus.

Dr. J. STAHL'S observations showed that after one hour's exposure to a one per mille, or a quarter of an hour's exposure to a 1⅓ per mille solution of **FORMALIN,** the most resistant forms of microorganisms were destroyed. **FORMALIN,** therefore, is equal at least in germicidal power to Corrosive Sublimate, and, under certain conditions, superior when Albuminoid Solutions are present.

**FORMALIN** may be applied in 1 per cent. solutions by Spray Diffusers, without damage to Furniture, Metal or Materials.

**FORMALIN** is supplied in one pound bottles.

**DIABETINE.** : : : : : : : :
The only innocuous and palatable sugar for Diabetics. A nutritive as well as an article of real enjoyment, which is completely oxidized in the system of the diabetic patient and therefore it is a positive substitute for sugar. It can be taken without harm and most nearly approaches the ideal carbohydrate food, indicated in diabetes.

**DIABETINE** has been endorsed by eminent authorities, notably by Profs. W. EBSTEIN, KUELZ, LEYDEN, Drs. H. VON HEBRA, MINKOWSKI, etc.

**DIABETINE** is supplied in one pound bottles.

**Salicylic Acid and Salicylate of Soda.**
The oldest and most favorably known brands.

**Chloral and Croton Chloral Hydrate.**
The oldest and best known brands in the market.

**Salol.**
Antirheumatic. Intestinal Antiseptic.

**Bismuth Salicylate.**
Basic 64% free from Subnitrate.

**Paraldehyd.**
Absolutely pure.

**Carbolic Acid.**
Redistilled for medicinal use in white crystals.

**Creasote.**
Strictly pure from beechwood tar.

**Glycerin.**
Twice distilled, chemically pure. Sp. Gr. 1,260.

**Tannin.**
Very light, chemically pure. Dissolves perfectly without precipitate in water, alcohol and ether.

**Gallic Acid.**
**Pyrogallic Acid.**
Eminently pure.

**SALOCOLL.**—(Phenocoll Salicylate) combines the action of Salicylic Acid and of Phenocoll, which in the form of hydrochloride has done such good service.

Practical experiments have shown that neither gastric disturbances, alterations of blood-pressure, nor cyanosis follow the administration of Salocoll. It has shown itself a reliable and safe anti-pyretic, anti-neuralgic and anti-rheumatic, having beneficial effects in many cases, where other remedies proved of no use. In influenza its beneficial effects were especially marked. The dose for adults is 15 to 30 grains in powder, several times a day; in appropriate subdivisions of this quantity it can also be given to children with safety.

**SALOCOLL** is supplied in 25 Gramme vials.

**KRESIN.**—A powerful antiseptic and disinfectant, completely and clearly soluble in water, for medical, surgical and hygienic use. An excellent deodorant and germicide in very dilute proportions. It destroys all contagious germs and foul odors and is therefore excellently adapted for the disinfection of excrementitious matter, water-closets, vaults, zincs, wastepipes, etc. It also destroys mould, fungi, and dry-rot in houses.

Endorsed by prominent physicians and extensively used in the Berlin Hospitals.

According to experiments made at Dr. E. RITSERT'S pharmaceutical, bacteriological and chemical institute, at Berlin, the antiseptic and disinfectant action of KRESIN, is far superior to that of Creolin and Lysol.

**KRESIN** is supplied in one pound bottles and ten pound cans.

**55 MAIDEN LANE, NEW YORK.**

**PAMPHLETS FURNISHED ON APPLICATION.**

# PARTURITION.

Aletris Cordial (Rio), given in teaspoonful doses every hour or two AFTER PARTURITION, is the best agent to prevent after-pains and hemorrhage. By its DIRECT tonic action on the uterus, it expels blood clots, closes the uterine sinuses, causes the womb to contract, and prevents subinvolution. In severe cases, it can be combined with ergot in the proportion of one ounce of fluid Ext. Ergot to three ounces Aletris Cordial (Rio). It is the experience of eminent practitioners, in all cases where ergot is indicated, that its action is rendered much more efficacious by combining it with Aletris Cordial (Rio) in the proportions above stated.

# DÉVIATION DES RÈGLES.

**ALETRIS CORDIAL** (Rio) is, perhaps, the most important remedial agent yet known. It is **THE** remedy for the wrongs of menstruation, by restoring normal functional activity to the uterine apparatus. Prolapsus, Menorrhagia, Leucorrhea, Amenorrhea, Dysmenorrhea, Subinvolution, Metritis, Ovarian Neuralgia, etc., all yield to its beneficial influence. Physicians find a certainty in its action as a uterine tonic, that is peculiar to no other remedy. A special indication for its use **IS THE DRAGGING SENSATION** in the lower bowels. It quickly restores the strength and waning vitality of chlorotic girls and pregnant women. Habitual miscarriage and the excessive nausea of early pregnancy are effectually prevented by its timely and continued use. In a word, it restores tone to the uterine system, and thus relieves all abnormal conditions.

*A full size bottle of ALETRIS CORDIAL will be sent FREE to any Physician who wishes to test it if he will pay the express charges.*

**RIO CHEMICAL CO., St. Louis.**

# Phytoline

## A POWERFUL ANTI-FAT.

A REMEDY PREPARED FROM THE ACTIVE PRINCIPLE OF THE BERRIES OF PHYTOLACCA DECANDRA.

**PHYTOLINE** is the only Remdy that will absorb fatty tissue in a great degree without any evil after effects whatsoever. By its powerful though harmless action it replaces morbid tissue with solid flesh.

THIS STYLE ONLY.

FOR OBESITY AND FATTY DEGENERATION OF THE HEART, PRESCRIBE:

℞ Phytoline (Walker) ℥ II

# THE SOLUTION.

It is frequently impracticable for those who are away from home to follow the oft-given advice to boil the ordinary drinking water.

The **N. Y. Medical Journal** advises the use of a pure Table Water, such as Apollinaris, which can be had everywhere.

The **Sanitary Record,** LONDON, says that Apollinaris is absolutely pure.

The **Medical Record,** NEW YORK: "Exceptionally favored; pure and agreeable"

To quote **Professor Liebreich,** BERLIN: "Apollinaris Natural Mineral Water issues from a spring deeply imbedded in a rock, and is therefore of absolute organic purity."

For Pamphlets,

ADDRESS CHARLES GRAEF & CO., 32 BEAVER STREET, NEW YORK.

# Antiseptics and Disinfectants

## For the PREVENTION of CHOLERA.

THE prevention of diseases is the unselfish mission of the modern physician. Antiseptics and disinfectants to-day occupy the first place in medical and surgical practice. We desire to call attention to the following antiseptic and disinfectant preparations.

**Ethereal Antiseptic Soap** (Johnston's) is an ethereal hydro-alcoholic solution of Castile soap which was devised by an experienced nurse in the surgical clinic of the Jefferson Medical College. *Directions.*—After wetting the hands thoroughly, pour a drachm or two of the preparation into the palm of the hand, spread it well all over the hands, and rub as with ordinary soap, using sufficient water to produce a rich lather. Its fluidity insures contact with every portion of the hand and nails. Its marvelous cleansing power renders it a valuable adjunct in the armamentarium of the physician and surgeon. It may be made weak or strong in antiseptic value by dissolving mercuric chloride in it in proportions indicated in the case in hand. Since its introduction its use has been extended to the treatment of parasitic affections with gratifying success.

**Antiseptic Liquid** arrests decomposition and destroys noxious gases that emanate from organic matter in sewers and elsewhere, and may be advantageously used in cellars, barns, outhouses, and the sick-room. (Send for Note on the Disinfectant of the Future, by Prof. Alfred L. Loomis.)

**Antiseptic Tablets** are convenient for the extemporaneous preparation of antiseptic solutions of definite strength for disinfectant purposes and for antiseptic sprays.

| *Formulas for Desirable Antiseptic Solutions:* | WINE MEASURE. | IMPERIAL MEASURE. |
|---|---|---|
| **1:1000**—Dissolve 1 tablet No. 180 in water | ( 4 fl. ozs.) | ( 4 4-25 fl. ozs.) |
| or 1 tablet ℞ "B" in water | (16 fl. ozs.) | (16 16-25 fl. ozs.) |
| **1:2000**—Dissolve 1 tablet No. 180 in water | ( 8 fl. ozs ) | ( 8 8-25 fl. ozs.) |
| or 1 tablet ℞ "B" in water | (32 fl. ozs.) | (33 7-25 fl. ozs.) |
| **1:4000**—Dissolve 1 tablet No. 180 in water | (16 fl. ozs.) | (16 16-25 fl. ozs.) |
| or 1 tablet ℞ "B" in water | (64 fl. ozs.) | (66 14-25 fl. ozs.) |

**Tablets of Yellow Oxide of Mercury,** containing two-hundredths of a grain of the oxide, are a valuable prophylactic against dysentery and enteric fever. They prevent fermentation and putrefaction, and render aseptic the alimentary tract.

**Eucalyptus and Thymol Antiseptic** is adapted for use as an antiseptic internally, externally, hypodermatically, as a douche, a spray, by atomization, and as a deodorant. Its application in surgery is unlimited. It combines the antiseptic virtues of boric acid, menthol, oil eucalyptus, oil wintergreen, and thymol.

**Disinfectant Powder** possesses in a high degree disinfectant, absorbent, and antiseptic properties. It is admirably adapted for the disinfection of excreta in cholera, yellow fever, and typhoid fever, and in all diseases in which such an agent is indicated for the purpose specified. It is composed of: Copperas, dry; charcoal, fine powder; slaked lime; carbolic acid, com'l; naphthalin, com'l.

**Labarraque's Solution** we supply for the use of those who desire to employ it for its local antiseptic action. It may be diluted to suit the indications.

**Sulphur Candles.**—Each Candle contains one pound of sulphur. The value of sulphur fumigations in contagious diseases is too well understood by the medical profession to require much comment. However, it is not easy to ignite pure brimstone or to maintain its combustion. These Sulphur Candles are easily ignited and will continue to burn until consumed. Especially adapted for the disinfection of rooms in which there have been cases of scarlet fever, diphtheria, etc., etc.

**WE SHALL BE PLEASED TO FORWARD, ON REQUEST, ANY DESIRED INFORMATION CONCERNING THESE PRODUCTS.**

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuertic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

To which all orders should be addressed.

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipped the water with a pewter mug, and filled kegs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

To THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.

*who, in addition to the remedies herewith described, prepare* SULFONAL-BAYER, SALOPHEN, LOSOPHAN *and* ARISTOL.

# Europhen

AS A COMPLETE SUBSTITUTE for IODOFORM no remedy is comparable to Europhen. It is the best known cicatrisant for open wounds, and catarrhal or ulcerative lesions, whether or not of a specific character; and it has a special value in cavital lesions.

EUROPHEN has five times more covering power than iodoform and adheres to denuded surfaces. It is supplied in ounces, pure, or mixed in equal proportions with Aristol.

# Phenacetine
## (BAYER)

THIS WELL KNOWN REMEDY has justified in the most exceptional manner the opinions of medical men touching its value in modern therapeutics. Phenacetine is indicated in all acute, inflammatory, febrile conditions, and all forms of pain. It is the safest, while the most active, of the antipyretics and analgesics.

PHENACETINE is supplied in *ounces, tablets* and *pills;* also in various combinations with Salophen, Sulfonal, etc.

# Piperazine
## (BAYER)

FOR LITHIASIS, acute and chronic gout, uric acid dyscrasia, and the gouty diathesis generally, no remedy has succeeded so well as PIPERAZINE. In Renal Colic and Urinary Hemorrhage, also, it is especially efficacious. PIPERAZINE-BAYER is made by a new process whereby its cost is greatly reduced.

PIPERAZINE-BAYER is supplied in *half ounces, ounces* and *tablets.* In painful conditions it may be combined with Phenacetine.

# Trional

TRIONAL is a nerve sedative and hypnotic which has given very satisfactory results in cases not amenable to treatment by other drugs. It is peculiarly valuable in cases of slight psychical excitement accompanied by obstinate insomnia. It acts promptly and is useful in many forms of delirium.

TRIONAL is administered in doses of 15 to 30 grains. Where pain is present Trional may be given conjointly with Phenacetine. *Supplied in ounces.*

*Physicians who wish to have the published testimony concerning the therapeutic action of these preparations, or information as to their chemistry or physiological action, should address*

**Sole Agents** **W. H. Schieffelin & Co.,** **For the U. S.**

**NEW YORK.**

# NOTE THE FOLLOWING.

## Fluid Forms of Hydrastis.

The reputation of this drug as a therapeutic agent was first gained through its employment in the form of an *infusion;* and in the fifty years following its introduction into medical practice a continuous effort has been made by manufacturers to perfect a preparation which would represent all the active principles of the drug, without the high price of the salts, either alone or in combination.

The most prejudiced writers on Materia Medica accord to the late Wm. S. Merrell the largest share of credit in the introduction of Hydrastis preparations, and to the present organization the reputation of being the *largest consumers of the drug in the world.* For more than a half-century Hydrastis has been made a study in our laboratory, and we do not think we exaggerate its importance when we assert that it stands pre-eminent to-day as the most valuable exponent of our vegetable Materia Medica.

## Fluid Hydrastis—MERRELL.

Is what its name implies—the active, medicinal principles of the drug in natural combination and in a fluid form. It has a bright yellow color, perfectly clear, free from sediment, and with an unmistakable odor of the *fresh drug.*

Fluid Hydrastis is a pure, neutral solution of all the alkaloidal constituents of the drug, rejecting the oil, gums, irritating and offensive resins, and inert extractive matters. The success attending its introduction is the best evidence of its therapeutic value.

Unsuccessful imitations and would-be substitutes are met with on every hand. Preparations said to be "just as good" or "about the same thing," but always "a little cheaper," attest the widespread and growing popularity of Fluid Hydrastis. All such, compared with the latter as to physical appearance or as representatives of the drug, *are condemned;* dispensed in prescriptions, *they are readily detected;* tested therapeutically, they are *promptly rejected* as unworthy of confidence.

Fluid Hydrastis is applicable to the treatment of all irritable, inflammatory and ulcerative conditions of the mucous tract.

This statement of a well known medical writer and journalist has become axiomatic:

"No remedy for physician's use has been received with such universal approval."

## Solution Bismuth and Hydrastia—MERRELL.

An invaluable and scientific combination, wherein the beneficial action of the white alkaloid is increased by association with Bismuth. This solution contains 2½ grains of the double Citrate Bismuth and Hydrastia; twenty-five per cent. of which is Hydrastia Citrate.

The cordial reception accorded this preparation marks it as the most valuable combination in the market in which the white alkaloid alone represents the valuable properties of the drug. Used in diseases of the nasal passages, of the eye, of the throat, of the stomach and intestines, of the reproductive organs and bladder it is equally beneficial.

## Colorless Solution of Hydrastia—MERRELL.

This is a permanent solution of the white alkaloid, without the addition of any other medicinal agent to modify or increase its action. It is offered without special recommendation to meet the views of a limited number of physicians, with whom the color of the Fluid Hydrastis is an objection. This solution contains in one fluid pint the same proportionate strength of white alkaloid as exists in an average quality of crude root.

See notes above on Solution Bismuth and Hydrastia.

# VIN MARIANI

## "The Standard Preparation of Erythoxylon Coca."

CAREFUL, continued testing by upwards of seven thousand practitioners in America, whose written opinions over their signatures (in our possession) are fully in accord and clearly prove the efficacy and merits of "VIN MARIANI," may be thus summarized:

"Diffusible stimulant and tonic in anæmia, nervous depression, sequelæ of childbirth lymphatism, tardy convalescence, general 'Malaise,' and after wasting fevers.

"Special reference to the nervous system, in all morbid states, melancholia, etc.

"Tonic in laryngeal and gastric complications, stomach troubles.

"All cases where a general toning or strengthening of the system is needed.

"The only tonic stimulant without any unpleasant reaction, and may be given indefinitely, never causing constipation."

N. B.—This wine has been found always uniform and reliable, owing to the selection of the finest ingredients and the greatest accuracy in its manipulation. When prescribing, therefore, the Medical Profession are strongly advised to specify "VIN MARIANI," in order to avoid the substitution of imitations, often worthless and consequently disappointing in effect.

Please specify VIN MARIANI.

Per case of half-dozen Bottles, - $6.00.
Per case of One Dozen Bottles, 12.00.

## WESTERN PENNSYLVANIA MEDICAL COLLEGE.

**Medical Department of the Western University of Pennsylvania.**

THE REGULAR SESSION begins on the last Tuesday of September, 1893, and continues six months. During this session, in addition to four Didactic Lectures, two or three hours are daily allotted to Clinical Instruction. Attendance upon three regular courses of Lectures is requisite for graduation. A three years' graded course is provided. The SPRING SESSION embraces recitations, clinical lectures and exercises, and didactic lectures on special subjects; this session begins the second Tuesday in April, 1894, and continues ten weeks.

The laboratories are open during the collegiate year for instruction in chemistry, microscopy, practical demonstrations in medical and surgical pathology, and lessons in normal histology. Special importance attaches to "the superior clinical advantages possessed by this College." For particulars, see annual announcement and catalogue, for which address the Secretary of Faculty, Prof. T. M. T. McKENNAN, 810 Penn Ave.

Business correspondence should be addressed to
PROF. W. J. ASDALE, 2107 Penn Ave., Pittsburg.

# PIPERAZIN

## URIC ACID SOLVENT.

ABOUT two years ago the Chemische Fabrik auf Actien, vormals E. Schering, of Berlin, after long experimenting in its laboratory by its staff of chemists, produced a new chemical product, which at first seemed to be identical with spermine. Through clinical trials this supposition was quickly found to be erroneous, but further experiments developed the interesting fact that the new product was a *uric acid solvent.* This notable scientific discovery was achieved independently by the Schering laboratory, and it deserves the full credit for enriching materia medica with so valuable a new therapeutic agent.

The name "Piperazin" was adopted for the product, and Piperazin (Shering) has in two years become widely known to the medical profession throughout the world, as the most powerful uric acid solvent known. Scores of clinical reports by the highest authorities, among them such names as BARDET, BISENTHAL, VON MERING, SCHWENNINGER, VOGT, EBSTEIN, D. D. STEWART, and J. H. BRADFORD (the last two named of Philadelphia), have been published in the leading medical journals of the world; and all **these reports were based solely on the use of the Piperazin made by Schering.**

Now recently, a German manufacturing firm which furnishes a number of other new remedies, has claimed to have discovered a new process yielding a product which they claim is identical with the Piperazin made by Schering; and without waiting to give their product thorough clinical trial, they and their agents are making the attempt to sell the untried product. With reprehensible enterprise they appropriated all the literature based on Schering's Piperazin for their own advertising purposes, and with other questionable methods, such as tempting by lower price, they bolster up their claim and bid for preference for their product.

Aside from the fact that this firm has *no moral right* to appropriate for its own profit the legitimate property of the Schering laboratory, it exhibits superlative presumption in inviting the medical profession to use a product with which not a single clinical trial has been made or published as yet.

**Caution**:—To avoid the risk of failure with a substitute product of untried nature, and to ensure such favorable therapeutical effects as reported by all authorities to date, be sure to specify

**"PIPERAZIN (SCHERING)."**

Full descriptive pamphlet, giving chemical, physiological and therapeutical data together with authentic clinical reports by authorities quoted above, will be mailed to physicians free on request.

# Calculi Dissolved

BY THE

## Buffalo Lithia Water

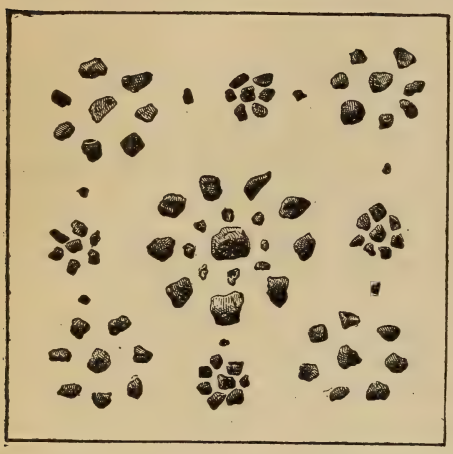

Illustration of the Calculi referred to by Dr. Claiborne. The engraving was made from a photograph and represents the exact shape of the Calculi; they are four times size of above.

**Dr. John Herbert Claiborne,** of Petersburg, Va., *ex-President and Honorary Fellow Medical Society of Virginia, in a letter, dated September 3, 1892, to Dr. E. C. Laird, Resident Physician at the Buffalo Lithia Springs,* says:—"I send by this mail a box of Calculi, passed at various times within the last year by Hon. T. J. Jarratt, our former Mayor, whilst drinking the Buffalo Lithia Water. They give him but little pain now when passing. I have never critically examined the broken Calculi, passed in such quantities from Mr. Jarratt's bladder, but am under the impression that the most of them are magnesian phosphates. There were specimens, however, which presented the appearance of oxylates, and some, I remember, impressed me specially as being uric acid. I do not pretend to account for the mode of their solution by the Buffalo Lithia Water. There is nothing in its analysis which would warrant such results; but the results are there, and seeing is believing. I can only suppose that **in Nature's alembic there has been some subtle solvent evolved, too subtle to be caught by our coarse re-agents, which make this wonderful disintegration.** 'There are many things in heaven and earth not dreamt of in our philosophy,' and his is a short creed who only believes what he can prove or explain."

**Water in cases of one dozen half-gallon bottles $5.00 f. o. b. here. Sold by all first-class druggists.**

# NEURALGIA.

THE one great characteristic of all varieties of neuralgia is debility of the nervous system, and whatever tends to produce structural or functional enfeeblements of the nerves induces neuralgia, hence all the causes inducing loss of nerve power may be cited as causes of neuralgia. This affection, when not directly the result of some physical cause interfering with the integrity of the nerve system in which the pain is situated, is invariably due to loss of nerve power. Its very existence is evidence of deficient energy. The remote factor may be malaria, syphilis, rheumatism, gout, or any other cause capable of devitalizing the organism, and as a consequence that of the nerves also. Our remedial measures should therefore be directed principally to improving the nutrition of the nervous system generally, and to the removal of any constitutional taint that may be present. The first indication is filled by CELERINA and a generous diet. In facial neuralgia and brow ache it should be administered in connection with quinine, or other tonic remedy, and if malarial influence be suspected, full doses of some reliable anti-malarial remedy should be given. The CELERINA treatment is also applicable to sciatic and spinal neuralgias. Neuralgia in men is frequently an expression of loss of nerve power, and the direct consequence of dissipation and excesses of various kinds, but over-work and intense intellectual exertion will also produce it. Where the pain is located is of little moment, the treatment should be general. In these cases CELERINA seldom fails to give relief. Women suffer more frequently and more intensely from neuralgia than men. They are liable to be affected by all the causes which induces it in men, besides the derangements in health associated with menstruation—menorrhea especially. Hyperfecundation (rapid child-bearing), frequent miscarriage, hemorrhage, prolonged lactation and changes occurring at the climacteric period of life, all tend to induce a neuralgic condition of the nerves. The general treatment should be directed to the removal of the cause whenever this is possible. In these cases CELERINA, combined with ALETRIS CORDIAL will be found to exercise a magical influence.

## RIO CHEMICAL CO.

A full size bottle of CELERINA will be sent FREE to any Physician who wishes to test it if he will pay the express charges.

GRANULAR EFFERVESCENT

**BROMO LITHIA**

(WARNER & CO.)

Each dessertspoonful contains

℞ Salicylate Lithia, 10 grs.,
and Bromide Soda, 10 grs.

A remedy in the treatment of

**RHEUMATISM, GOUTY DIATHESIS, ETC.**

Dr. A. Garrod, the well-known English authority on Gout, who was the first physician to introduce the Lithia Salts in the treatment of the gouty diathesis, states that their action is materially increased by being administered in a *freely diluted form*

This effervescing salt of Lithia furnish an easy and elegant way of applying Dr. Garrod's methods.

PREPARED ONLY BY

**WM. R. WARNER & CO.**

For Nervous Headache and Brain Fatigue.

WARNER & CO.'S EFFERVESCING

**BROMO SODA**

(WARNER & CO.)

**Useful in Nervous Headache, Sleeplessness, Excessive Study, Over Brainwork, Nervous Debility, Mania, etc., etc.**

DOSE.—A heaping teaspoonful in half a glass of water.

It is claimed by some prominent specialists in nervous diseases that the Sodium Salt is more acceptable to the stomach than the Bromide Potassium. An almost certain relief is given by the administration of this Effervescing Salt. It is also used with advantage in INDIGESTION, DEPRESSION following alcoholic and other excesses, as well as NERVOUS HEADACHE. It affords speedy relief for MENTAL and PHYSICAL EXHAUSTION.

PREPARED ONLY BY

**WM. R. WARNER & CO.**

**Mellin's Food**

**For Infants and Invalids.**

A SOLUBLE DRY EXTRACT of Barley Malt and Wheat, for addition to Fresh Cow's Milk.

Prepared upon the principles advanced by the eminent chemist, Baron Justus von Liebig.

EXPERIENCE — the supreme test — has absolutely proven that the best solution of the problem of infant feeding was made by LIEBIG, and that MELLIN'S FOOD prepared with milk is the nearest approximation to, and is the BEST SUBSTITUTE for, Mother's Milk which has ever been devised.

THE DOLIBER-GOODALE CO., BOSTON, MASS.

# The Demand For

a pleasant and effective liquid laxative has long existed—a laxative that would be entirely safe for physicians to prescribe for patients of all ages—even the very young, the very old, the pregnant woman, and the invalid—such a laxative as the physician could sanction for family use because its constituents were known to the profession and the remedy itself had been proven to be prompt and reliable in its action, as well as pleasant to administer and never followed by the slightest debilitation. After a careful study of the means to be employed to produce such

# A Perfect Laxative

the California Fig Syrup Company manufactured, from the juice of True Alexandria Senna and an excellent combination of carminative aromatics with pure white sugar, the laxative which is now so well and favorably known under the trade name of "Syrup of Figs." With the exceptional facilities, resulting from long experience and entire devotion to the one purpose of making our product unequalled, this demand for the perfect laxative

# is met by Our Method

of extracting the laxative properties of Senna without retaining the griping principle found in all other preparations or combinations of this drug. This method is known only to us, and all efforts to produce cheap imitations or substitutes may result in injury to a physician's reputation, and will give dissatisfaction to the patient; hence, we trust that when physicians recommend or prescribe "Syrup of Figs" (Syr. Fici Cal.) they will not permit any substitution. The name "Syrup of Figs" was given to this laxative, not because in the process

# of Manufacturing

a few figs are used, but to distinguish it from all other laxatives, and the United States Courts have decided that we have the exclusive right to apply this name to a laxative medicine. The dose of

# "SYRUP OF FIGS"

as a laxative is one or two teaspoonfuls given preferably before breakfast or at bed time. From one-half to one tablespoonful acts as a purgative, and may be repeated in six hours if necessary.

"Syrup of Figs" is never sold in bulk. It is put up in two sizes to retail at fifty cents and $1.00 per bottle, and the name "Syrup of Figs" as well as the name of the California Fig Syrup Company is printed on the wrappers and labels of every bottle.

CALIFORNIA FIG SYRUP COMPANY

SAN FRANCISCO, CAL.

LOUISVILLE, KY. NEW YORK, N. Y.

# This is not an Apology.

WASHINGTON, D. C., July 28th, 1893.

I had stopped the further issue of my circular letter of May 15th, as Messrs. Parke, Davis & Co. had informed me that they would cease the sale of their so-called "Cerebrin" under my name. But as they have seen fit to publish in the medical journals, as an advertisement, under the heading of "An apology," a tirade of abuse, almost every line of which expresses a falsehood, additional notice of these people seems to be requisite.

In this screed they give it as *their* opinion that *my* opinions are of no value. This is a point that I may well be excused from discussing; but as the second-named member of the firm in question, and the one who I understand is mainly responsible for the policy of his concern, is the publisher of two books of mine, "Spinal Irritation" and "Sexual Impotence," both of which he has lauded to the profession in what I must confess to be rather fulsome language, he is scarcely in a position to question the value of my opinions. The fact, too, that this firm was so eager to use my name in connection with their counterfeit "Cerebrin" shows that they continued almost up to the present time to attach some worth to my opinions. Who does not know that if I had allowed their disgraceful proceedings to go on unchecked that my opinions in Messrs. Parke, Davis & Co.'s estimation would have retained their pristine value? I exposed them May 15th; therefore my opinions have been unentitled to respect for a little more than two months. "Happy is he," says Lucretius, "who is able to discover the causes of things."

And they conclude their advertisement by announcing that they will still continue to supply "Cerebrin" made after their own formula. A product which they have almost in the same breath acknowledged to be worthless; and which is worthless.

Now, let us see if we cannot from Messrs. Parke, Davis & Co.'s conduct in regard to "Cerebrin" form some idea of the value of their other pharmaceutical preparations.

On the label of the bottle containing their so-called "Cerebrin" is this statement:

"NOTE.—While Dr. Hammond has recommended maceration of the brains for six months, we have modified his method so that we are enabled to thoroughly extract the valuable properties in much less time."

Here is a positive assertion that they have succeeded in extracting the "valuable properties" of the brain of the ox. Did they make this claim recklessly and falsely, without verification, or did they really succeed, as they assert, in obtaining a valuable product from the brain tissue? If the former, what are we to think of a firm manufacturing medical preparations that can seek thus to impose on the public? If the latter, how are we to reconcile their language with that of their latest publication, in which they offer "an apology" for introducing what they now declare to be worthless? Is not such conduct calculated to provoke a feeling of distrust of all the claims they make relative to the superior purity and efficacy of their manufactures? How are we to know, for instance, that they have established the truth of the statement they make in regard to their so called "normal liquids," that—

"These preparations are adjusted to a uniform strength of assay, irrespective of the quantity of crude drug required, thereby imparting to them a definite therapeutic value."

There is a legal maxim that comes to mind in this connection. It is: *Falsus in uno, falsus in omnibus.*

In endeavoring to provide for the purity of the animal extracts, made according to my formulas, by placing the sale of them to the profession in responsible hands and in superintending their manufacture I have done nothing unprofessional. I have fully disclosed the methods of preparing these extracts, and Messrs. Parke, Davis & Co. know perfectly well that they or any one else can manufacture them with impunity, and may even announce them to the profession as being made by my formula, *provided* they are so made; but when Messrs. Parke, Davis & Co. modify my formula, refuse to tell me in what the modification consists, and then announce that the product is made in accordance with my method, they are guilty of conduct that most people would look upon as nefarious and practically scarcely, if at all, to be distinguished from the act of getting money under false pretenses.

It is certainly not to be expected that I should gratuitously provide the public with animal extracts any more than that I should give them my books. Pasteur, Brown-Sequard, Koch, and others who have made important discoveries in medical science are surely entitled, while creating no monopoly in any healing process, to reap some pecuniary reward from their labors, and the propriety of their so doing has hever been questioned. Would it be just and right that Dr. Marion Sims, Dr. Weir Mitchell and others who have advanced therapeutics, should refrain from establishing hospitals in which their peculiar methods of treatment can be carried out under their own supervision? Do we not all expect something more than mere thanks for our work? The charge ef being mercenary comes with a bad grace from a drug firm that has never made a single advance in pharmaceutical science, but has gone on year after year watching the procedures of other more original workers and appropriating the results of their labors as soon as they have perceived that money was to be made by so doing.

It would be easy to adduce many instances showing the immanent predatory characteristics of this firm; they have filched right and left, and have even had the hardihood to publish a record of their incursions, into other realms not their own. Wherever they saw a valuable discovery they sailed in to avail themselves of it, nor have they confined themselves to the pharmaceutical profession. Scientific monographs have not escaped them, and with a boldness that would have been admirable if displayed in a good cause they have not hesitated to pirate whatever they thought would advance their trade interests. Here, too, I have been their victim, for without my consent or that of my publishers, Messrs. Appleton & Co., and even without our knowledge, they reprinted in pamphlet form my original paper on the animal extracts, knowing the same to be copyrighted, and sent it broadcast through the country in furtherance of the sale of their bogus product. If this is not a pre-eminent instance of turpitude it would be difficult to find one.

It would be interesting to know just what modification they made in the original process. The probabilities are a thousand to one that it was nothing more than shortening the period of maceration to a few days, and this could only have been done with the "mercenary" ("I thank thee" [Messrs. Parke, Davis & Co.] "for teaching me this word"), object of forestalling the market and getting a quick return for their money.

And what were the "valuable properties" that they declare they extracted from the ox brains? And why did these "valuable properties" suddenly disappear soon after May 15? These are questions the answers to which I am going to wring out of Messrs. Parke, Davis & Co. if there is anything to be gained by the most obdurate persistency.

Finally, I have no disposition to deal hardly with Messrs. Parke, Davis & Co. They have, it is true, been guilty of a mean crime; but I have been actuated more by a desire to reform than to punish them. Many eminent physicians and chemical manufacturers throughout the country inform me that I have rendered a service to the public by exposing the extremely wicked conduct of these people. If I have in addition done good to the wrong-doers my satisfaction will be complete.

WILLIAM A. HAMMOND.

# BROMIDIA.

Each fld. dr. contains 15 gr. *each* Pure Chloral Hydrat. and Purified Brom. Pot., and ⅛ gr. *each* Cannabis Indica and Hyoscyam. Dose—One-half to one fld. drachm in water or syrup.

# METCALF'S COCA WINE

Always Uniform
Therefore
Always Reliable

**FOR FATIGUE OF MIND OR BODY**

Made from Fresh Coca Leaves and the Purest Wine

**RECOMMENDED FOR**

**NEURALGIA, SLEEPLESSNESS, DESPONDENCY, ETC.**

**As a Tonic and Invigorator it is always Safe, Agreeable and Certain, being prepared with the utmost skill and precision from the freshest Coca Leaves and the Purest Wine obtainable.**

RINGER recommends COCA LEAVES, as of great value in Febrile Disorders, by restraining tissue metamorphosis, and for the same reason in Phthisis. For their decided anodyne and anti-spasmodic qualities, they have been successfully employed in Typhus, Scorbutus, Gastralgia, Anaemia, Enteralgia, and to assist digestion.

COCA WINE is probably the most valuable Tonic in the Materia Medica *when properly prepared.* With stimulating and anodyne properties combined, **Metcalf's Coca Wine** acts without deliberating, being *always uniform and therefore always reliable.* For Athletes it is invaluable in imparting energy and resisting fatigue; Public Speakers and Singers find it indispensable as a "Voice Tonic," because, being a "tensor" of the vocal chords, it greatly strengthens and increases the volume of the voice; and to the elderly it is a dependable aphrodisiac, superior to any other drug.

**Physician's Sample Bottles**, by express, carriage prepaid, upon the receipt of **One Dollar.**

DR. ARCHIBALD SMITH—"PERU AS IT IS"—states that "Coca" increases energy, removes drowsiness, enlivens the spirits, and enables the consumer to bear cold, wet, great bodily exertion and even want of food, to a surprising degree, with ease and impunity.

## NATURE'S REMEDY

## For diseases of the Liver, Stomach and Kidneys

### The Famous Bedford Mineral Springs

N. W. Cor. 16th and Walnut Streets,
Philadelphia, Pa., January 27, 1891.

*Dear Doctor:* I have been in the habit of sending patients for many years to Bedford Springs, and also prescribing the water to patients in the city. I can most conscientiously certify to the value of the water medicinally.

I regard Bedford Spring Water as one of the most valuable waters in this country for all functional diseases of the liver and digestive organs. It is aperient, alterative, and diuretic.

D. HAYES AGNEW, M. D.

---

I take pleasure in certifying to the value of the Bedford Springs Mineral Water. I have used it for years in my practice, and I consider it better than the Carlsbad water in many respects. I think that Americans would do better to go to the Bedford Springs than to Carlsbad, which place I have visited. The water is aperient, diuretic and alterative, and most useful in functional troubles of the digestive organs.

WILLIAM H. PANCOAST, M. D.
Prof. Anatomy, Medico-Chirurgical College.

write to say if you desire to use my name as a reference in connection with Bedford Springs, I am willing that it should be so used.

Yours very truly, WM. PEPPER,
Provost of the University of Penna.

---

*Dear Sir:* I am pleased to testify to the efficacy of the Bedford Mineral Water in chronic catarrhal jaundice, and also in chronic bilious dyspepsia. I have seen the good effects upon a number of patients, and have personally experienced great and permanent benefit in the latter affection.

Very sincerely yours, R. G. CURTIN, M. D.
22 South 18th Street, Philadelphia.

---

Washington, D. C., April 17, 1895.

*Dear Sir:* It gives me great pleasure to testify to the value of the Bedford Mineral Springs Water in functional diseases of the liver. I have frequently spent a part of the summer there during the last twenty years, and am qualified from actual experience in noting its effect upon many cases to certify to its efficacy. In my opinion there is no other water in this country equal to it for the class of cases mentioned.

Very truly yours, FRANCK HYATT, M. D.
Physician to the late James G. Blaine.

**The Springs Hotel is open from June until October.**

*AGENTS WANTED IN EVERY CITY OF THE WORLD*

Old Resident of Londonderry, New Hampshire, unwilling to admit that "Doctors and Fancy Apothecaries" discovered therapeutic value of the famous Londonderry Spring! A spicy letter.

LONDONDERRY, N. H., June 5, 1893.

GENTLEMEN — I want you to stop advertising that *Londonderry Lithia* was discovered by the doctors to be a remedy for rheumatism, etc. Now, I was born right in sight of that spring of yours, have lived there ever since, and knew it would cure Rheumatism when your folks wore short clothes. I dipp[illegible] with a pewter mug, and fi[illegible]gs for people who had Rheumatism years and years before your new-fangled pumps and fancy bottling machines were invented. We old settlers were not fools, and you folks don't know any more about that water than my great grandfather did. With all your doctors and experts who come here you did not know it would cure humors of the blood until I told you. Your fancy chemists try to tell *me* what is in this water, but *I* tell *them* it was *always there,* and that it would have staid there and cured folks if they had never been born! I may seem crusty, but I don't like to see you folks try to shove all the credit of discovering this spring on doctors and fancy apothecaries.

Yours for justice, J. M. AVERY.

TO THE LONDONDERRY LITHIA SPRING WATER CO., Nashua, N. H.

---

NOTE.—While what Mr. Avery says is practically true, it is also true that no scientific explanation of the remarkable control this water exhibits over rheumatism and uric acid diseases was attempted until the physicians took it in hand.—LONDONDERRY LITHIA CO.
